> Yes, but most likely every user would need there own, separate, $85 GMRS license to legally use.

An employer can try to "sell" its employees on the fact that that $85 license can cover their entire family - so that "more sophisticated comms" could occur for the whole family for that measley $1.42/month for licensing.

Conversely, frequency acquisition, FCC licensing, and commercial equipment could be a little more expensive.

Clint, I'm not sure what your trying to say. But if all employees, other cousins, then yes, all could operate on one license. Or if several families worked for the same employer, each family group could each have their own shared license. All others would each have to have their own license.

This is the same image file as the last one.

I have added the repeater you requested in channel 2 and channel 3. Channel 2 will TX the CTCSS tone to access the repeater. Channel 3 will TX the CTCSS tone like channel 2 and also requires receiving the CTCSS tone to open the squelch of your receiver (since the repeater listing says TX/RX for the CTCSS tone).

First, I defer to those of you more knowledgeable about the GMRS licensing requirements (re: family vs. group licensing), but nothing I read in the original posting (that I remember anyway) mentioned whether or not any or all of the folks in this "company" were related or not.

Second, "if" this is a real company and they get caught cross-banding from MURS to FRS/GMRS (assuming for a moment that they actually do it), the fines leveled against them by the FCC would be much higher in cost than the $85.00 GMRS 5 year license, even if they had to purchase several of them for their employees.

Now they may be in the middle of a wilderness area with very little (if any) other RF traffic, but unless they are, the odds of them doing a MURS to FRS/GMRS cross-banding on any kind of permanent basis (without being overheard by somebody else) aren't the kind of odds I would want to bet my business income on, but that's just me.

In June of this year, the FCC assessed Remel, Inc. (located in Kansas) and its parent company Thermo Fisher Scientific Company, Inc. $30,000 for “willful and repeated” unlawful radio operations on a General Mobile Radio Service (GMRS) frequency. To be fair, they got away with it for years, but $30,000 is still a large chunk of change to pay vs. $85.00 for a five year license ($1.42 a month), and yes, I understand that they may have had to purchase more than one license, but even 10 licenses would have cost them $850.00 over 5 years, or $170.00 a year.

I still think it's cheaper (in the long run) to not risk your business with heavy fines, possible confiscation of the communications gear you already paid for, and bad press to avoid sending the FCC a small check. It's not like anyone there had to pass a license test or anything, it's just writing a check.

Topic: 31799 Message: 31889

The current GROL issue seems to be covered here:

<http://wireless.fcc.gov/commoperators/index.htm?job=wncol>

"You do NOT need a commercial radio operator license to operate, repair, or maintain any of the following types of stations:

a.. Two-way land mobile radio equipment, such as that used by police and fire departments, taxicabs and truckers, businesses and industries, ambulances and rescue squads, and local, state, and federal government agencies."
It would seem to me that having an Amateur Radio license would seem to indicate a passing knowledge of radio theory and operation.
Also FCC regulations are fluid, often not needing an act of congress to change.

I was not advocating claiming the entire business was one big family (grin), just pointing out that employees' families would be covered under their licenses, opening up GMRS comms to them.

It was just an off-the-wall comment - no hidden agenda.

This time ...

31893. Fun with UV-5R and CHIRP

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-01 04:30:11 UTC
From: tenorman1952
Topic: 31893 Message: 31893

I just returned from Florida. My wife and I flew out, cleaned out my Mother in Law's storage unit, and drove a rental truck back home.

We started in Vero Beach, FL, on the FL east coast, and quite a way down, went up I-95 through Daytona Beach, passed by Cape Canaveral, etc, up to Jacksonville. There we took the I-295 loop around to the west, to I-10 for the rest of home.

I brought one of my UV-5Rs. This was connected with a BNC adapter through a 4' long pigtail (Associated) made from thin (about 1/8") LMR-100 low loss coax, to a SO-239 socket. That connected to the coax coming from the mag mount I stuck on the roof of the cab. On the mount was a Diamond 1/4 wave antenna, NR72BNMO, about 14" long.

In the past I've gotten good results from this antenna in Baton Rouge and New Orleans in my wife's van.

Before leaving home I programmed the radio with CHIRP. From Pensacola to home I had a list of repeaters along I-10 I had loaded for a friend a while back, but for the repeaters from Vero Beach up to Jacksonville, then over to Pensacola, I got repeater information here:

http://www.artscipub.com/repeaters/search/index.asp?state=Florida

Florida is VERY active as far as ham repeaters. The repeaters were far too numerous along our route to load them all. Instead I loaded only the ones that were listed as club sponsored repeaters. My reasoning was that the information would likely be more up to date, the repeaters would likely be the most active in their areas, and likely to have the highest antenna mounting for best range. This proved to be an effective strategy.

All along the route, even when I didn't make a contact, I was still able to hit the repeaters showing that frequency and tone information was correct.

Once back home in just a few seconds CHIRP restored the UV-5R using the previous saved image.

I didn't make a lot of contacts, and nothing was heard on 146.52 mhz, but it was still fun.

Paul - AE5JU

I apologize if this was answered before, my search of this group and Web did not find exactly what I was looking for.

Is it possible to send DTMF message (e.g. to open repeater channel) as an automated sequence and how?
I have programmed sequence but pressing PTT+number that corresponds to the programmed sequence most of the time produces only the tone that correspond to that digit, and occasionally something that, in duration sounds like 5 digit DTMF message, but but there is a only single tone, not clear sequence

I have only found posts that mention manually typing sequence every time you need it, but then I do not see any sense of programming DTMF sequences via software. I expect there must be a way to do it, my 20 year old Alinco DJ F1 can do that.

I appreciate any answers.

Program a second channel for the repeater and set it up with PTT-ID. That channel will be able to send a 5-digit DTMF sequence when the PTT is pressed, released or both.

Just switch to the channel with PTT-ID when you want to send the command and switch back to the regular channel when you don't.

Use PTT-ID and ANI together and you would be able to create a 10-digit sequence (5 when PTT is pressed and 5 more when PTT is released).

Which repeater are you trying to listen to (use http://www.radioreference.com/apps/db/?ctid=1022 to find geo location)? And how far away is it (use google earth to find out)? And what does your line-of-sight look like from you to the repeater tower (use google earth elevation profile)?

You may be in a blind spot for the repeater you're trying.

And how long are you listening to say there's nothing going on? Find out when shift change is and listen from shift start time to about 30 minutes after and you should hear cars coming on duty.

Fred,

Go back to the way you had it. Unless you know and understand why you would use a different setting, Tone Mode for a receive only channel needs to be set to "(none)". Tone Mode for a channel that you will be transmitting on should have Tone Mode set to "Tone" if a tone is required by the other station(s).

Having a receive requires an understanding of how CTCSS (or DCS) works or you can wind up not being able to hear anything on the channel.

The basic idea stems from this .how do you keep from hearing stuff you don't want to hear?

Repeaters will most often require you to transmit a tone so they can eliminate interference and people who don't know what they doing.

So that's the channel 2 setup.

Channel 3 turns on the receive tone (i.e. eliminates any transmission that does not contain the tone).

I see the Louisville also has a 147.120 repeater about 68 miles away. It's possible that somebody with a good 2M antenna half-way between could hear both so that may be why k4ukh added a transmit tone for those that want it (it's optional and you only need receive tone if you hear interfering transmisssions you don't want).

If you took your radio to Louisville you would be to hear on Channel 2 but not Channel 3 (since they don't send a tone).

It's pretty rare to find a repeater that TRANSMITS a tone. Most people just listen to everything on the repeater.

But if you're in an overlap area where you might pick up 2 repeaters they will use different tones so you can set your radio to receive one or the other and eliminate the one you don't want.

Hope this explanation helps.

Subject: Re: [baofeng_uv5r] Re: ABSOLUTE and complete new ham, question about a step by step programming tutoria

Jim, both channel settings function but can I ask what the difference in the settings is functionally? I think I understand more about how to translate the settings from a web page to a setting in chirp now but reading your post I know I'm not fully understanding it

On Wed, Jul 31, 2013 at 7:58 PM, Fred Weckerling <fred.weckerling@...> wrote:

http://www.qsl.net/ai4uk/repeaters.htmlcan anyone explain how to understand the configuration information on this site? I am trying to configure k4ukh from the list and getting the same thing as the police band. static instead of trarsmission. attached please see present config file

Fred,

This is the same image file as the last one.

I have added the repeater you requested in channel 2 and channel 3. Channel 2 will TX the CTCSS tone to access the repeater. Channel 3 will TX the CTCSS tone like channel 2 and also requires receiving the CTCSS tone to open the squelch of your receiver (since the repeater listing says TX/RX for the CTCSS tone).

OK. Some versions of the Baofeng software have the flashing issue if the cable is missing. But if your friend is running the same version as you, then that must not be the problem. If the version he is trying is the v12.07.25 VIP version, he might try the v12.10.25 CPS version that works for all firmware versions. He's got nothing to lose trying it.

By XP Comp mode, are you referring to Bootcamp? Did he install the
bootcamp drivers in windows after installing it? Without those drivers
the mac hardware won't work with it. You'll be able to login to windows
but the USB, Camera, etc likely won't work.

I run chirp in XP on my mac but not with bootcamp - I use parallels.

31905. RE: [baofeng_uv5r] TYT BCG-FY8 charger issues

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-01 16:30:43 UTC
From: Michael Black
Topic: 30947 Message: 31905
Attachments: 1 described; binary payloads are missing from this source WARC

Here's the results of my charger tests on the Baofeng CH-5 charger

I'm pretty well convinced it's over saturating which will reduce the life of the battery.

The CH-5 is going to ~24ma.

http://batteryuniversity.com/learn/article/charging_lithium_ion_batteries says 3% of rated -- so 54mA for BL-5 and 84mA for BL-5L

BL-5L Run#1 was at low power warning --- charge time of 9.7 hours

BL-5L Run#2 was over it had drained quite a bit more (I didn't measure the voltage at that time) 11.0 hours

BL-5 Run#1 was very drained down to 0.2V - 7.6 hours

BL-% Run#2 was at low power warning - 6.6 hours

There's a 470ohm resistor which I suspect is the current cutoff but I can't find any docs on the chip on this thing to be sure.

I think I'm going to try and reduce that value, measure the voltages/currents and see if that will change the cutoff.

Low power warning occurs at ~6V

Now I need to do some wiring to do similar testing for the TYT BCG-F8.

Note the OP said that they were running XP (i guess in Parallels) on an old eMac; that's not an Intel machine and I know Chirp for Mac won't work, and I doubt even the XP version will in something emulated like that. Then there are the driver issues.

He might be able to put together a Linux LiveCD that would run Chirp, although getting to run on old PowerPCs would be a bit of a chore I suspect.

The OP is trying to get the Baofeng software to work. He stated in the OP
that CHIRP works.

I'm curious what driver he is running. On Win 7 with a clone cable, I can
run CHIRP with a v3.3.2.105 driver but the Baofeng software wouldn't run. I
had to drop down to a v3.2.0.0 driver for both CHIRP and Baofeng to work. I
wonder if there is a similar issue with the XP cable driver?

He typed "He is running th eMac in XP mode." I'm assuming it's more likely he meant "the Mac" and swapped the space and "e" in "the". I assume "XP mode" means running XP via bootcamp, but we never clarified that.

A true (PowerPC) eMac won't run XP (or any version of windows). No way, no how. OK, well, maybe if you could find an old version of WinNT 4 for PPC, and then... :-)

Don, is your friend booting into XP natively via bootcamp or in Parallels/VMwareVirtualBox running on Mac OS. It will change things slightly (mapping USB devices to a VM isn't always clean).

Michael thank you for the information. As a further update to Jim, the police channel is working with some cars specifically unit 3 whoever that is. But other transmissions are purely static. So I can only assume it's the digital vs analogue issue

-------- Original message --------
From: Michael Black <mdblack98@yahoo.com>

To: baofeng_uv5r@yahoogroups.com
Subject: RE: [baofeng_uv5r] Re: ABSOLUTE and complete new ham, question about a step by step programming tutoria

The basic idea stems from this …how do you keep from hearing stuff you don’t want to hear?

Repeaters will most often require you to transmit a tone so they can eliminate interference and people who don’t know what they doing.

So that’s the channel 2 setup.

Channel 3 turns on the receive tone (i.e. eliminates any transmission that does not contain the tone).

I see the Louisville also has a 147.120 repeater about 68 miles away. It’s possible that somebody with a good 2M antenna half-way between could hear both so that may be why k4ukh added a transmit tone for those that want it (it’s optional and you only need receive tone if you hear interfering transmisssions you don’t want).

If you took your radio to Louisville you would be to hear on Channel 2 but not Channel 3 (since they don’t send a tone).

It’s pretty rare to find a repeater that TRANSMITS a tone. Most people just listen to everything on the repeater.

But if you’re in an overlap area where you might pick up 2 repeaters they will use different tones so you can set your radio to receive one or the other and eliminate the one you don’t want.

Hope this explanation helps.

Jim, both channel settings function but can I ask what the difference in the settings is functionally? I think I understand more about how to translate the settings from a web page to a setting in chirp now but reading your post I know I'm not fully understanding it

http://www.qsl.net/ai4uk/repeaters.htmlcan anyone explain how to understand the configuration information on this site? I am trying to configure k4ukh from the list and getting the same thing as the police band. static instead of trarsmission. attached please see present config file

Fred,

This is the same image file as the last one.

I have added the repeater you requested in channel 2 and channel 3. Channel 2 will TX the CTCSS tone to access the repeater. Channel 3 will TX the CTCSS tone like channel 2 and also requires receiving the CTCSS tone to open the squelch of your receiver (since the repeater listing says TX/RX for the CTCSS tone).

Randy, can you confirm that the USB-to-serial adapter is properly forwarded to the VM, is showing up in XP's device manager, and has a driver installed and a COM port assigned? When using a VM, the first thing I'd check is USB forwarding. Parallels is the one VM environment I'm not familiar with (vs VirtualBox, VMWare, or Xen), so I can't give you specifics on what to check.

I assume you using an RS232 (DB9 or DB25) programming cable, that is plugged into the USB-to-serial adapter?

I've cc'ed the uv5r Yahoo group; if you haven't signed up already, you should.

How far a way are you from the area your trying to receive ?
Have you tried resetting the radio ?
Can you normally receive the US Weather ?
Did you try contacting another person who has a scanner to find out if it's possible to receive where you are ?
Did you try going to Radio Shake and try there scanner or talk with someone there if your not able to find someone with another radio ?

Have you manually tried to scan on the unit a small range of frequencies based on RR during the day to see if there is any active channels.. Rather than typing in all that information ?

I would also if you have it try another antenna /// if all this fails.. contact your vender and ask for a return if nothing is receivable

The way you describe the receive almost like CTCSS (DCS) the receive is turned on with a PL on rx.. reset using the menu on the radio. Don't use channel 0.
Look through the menu with default in and check that rx is does not have a PL turn on..but the light will also turn on if the squelch up high. Turn down low 1 or 2 cause that can also give the same effect with the green light going on and off.

If all else fails contact seller you purchased from. Good luck.. try these suggestions and let us know if anything helps solve your problem.

*Thanks

Way more than 80% of the Baofeng radios that I've seen (with user's complaining they must be broken) end up being either poorly programmed by the end-user, or they simply don't understand the way their radios really work.

I've even seen some folks complain that they can't get the same frequency that their friend's Motorola TRBO digital radio gets, not understanding even the basics of analog vs. digital, not to mention how many times folks turn on PL or DCS on receive and then wonder why the little light comes on but they hear no audio.

I can understand having a technical issue with folks that always buy their electronics at the local super-box warehouse store, but some of these folks with call signs really should know better, or at least google a possible solution first.

Hi all.

First off, I have been a member for a few months now. Thank you all for the entertaining information provided. I see the questions that must leave some of you guys slapping your foreheads. And I hope this isn't one of those questions.

We have a collection of work issued GP328's (Motorola) and we also use the uv5r for our own closed channel conversation. Using a counter we have ascertained the work frequency and entered into the baofeng. We can tx motorola==> Baofeng but when we try the other way the motorola light flashes like it is receiving but we get no sound. Baofeng==> baofeng works fine.
Have tried all the S codes on menu #17 with no luck. They appear to be on simplex.. any thoughts?.

The Motorola radios are set to require CTCSS tone or DCS code to open thier squelch. They also transmit this tone/code to unlock the squelch of the other Motorola radios so that they can communicate together.

The reason that the Baofeng receives is because you have programmed no receive tone/code. As I have said many times, programming no receive CTCSS tone and no receive DCS code always works.

You have either programmed no transmit CTCSS tone/DCS code (likely) or the wrong tone/code has been programmed.

Menu 17 (S-CODE) has nothing to do with your problem. It is menu 12 (T-DCS) or menu 13 (T-CTCS) that you need to address. My guess is that you don't know if the Motorola radios are using CTCSS or DCS and more importantly the tone or code that either would require.

What you need to do then is visit the Miklor.com website for the UV-5R and review the "Scanning for CTCSS and DCS Tones" page. It explains how you can use the UV-5R to read the tone/code that is being transmitted by the Motorola radios. Then, depending on how you are programming your radios, you will have to update the transmit CTCSS tone or transmit DCS code based on what you determined the Motorola radios are using.

Technically, yes (assuming that the frequency used there is within 136-174 Mhz and 400-520 MHz and not digital).

Legally, only if Walmart has a license that requires part 90 radios and the person(s) in authority give you permission to setup and use a radio on that frequency.

I've read that most Walmarts use MURS frequencies, which can't be used
legally on the UV-5R.

Doesn't Walmart supply radios to their employees?

I can open the same program on my windows machine in either XP or Win 7 with with no issues, with no cable installed.
The point is that the Mac seems to have some issues and he is wondering if there are some settings re the xp compatibility mode on the Mac.
OK. Some versions of the Baofeng software have the flashing issue if the cable is missing. But if your friend is running the same version as you, then that must not be the problem. If the version he is trying is the v12.07.25 VIP version, he might try the v12.10.25 CPS version that works for all firmware versions. He's got nothing to lose trying

it.

Hi Greg and the Group
Well I managed to get it working.
First off I am using an Intel MacBook running Parallels and XP. My serial to USB adapter is of the FTDI chipset variety. I was not sure I had the most up to date driver so I downloaded a new driver and installed that.
Then I was reading the that suggested that cable needed to be plugged in so I tried that but that did not seem to work . Then I realized that I had the USB to serial cable plugged in while I was in the Mac OS environment so when I launched XP via Parallels the cable was still capture by the Mac OS. Once I unplugged the cable and plugged it back in a pull menu from Parallels asked for my choice of OS once I chose XP the Baofung Software started play nice.
My next test is to see if I can read and write the radio.

I want to thank the group for all the tips

I just don't understand the mentality of this group. Telling this guy how to illegally use this radio without telling him he needs a license to use it. Walmart uses. MURS frequency, this radio is not legal for use on any MURS frequency and requires a license to use on ANY business band frequency except ham bands, no exceptions!

First off, I have been a member for a few months now. Thank you all for the entertaining information provided. I see the questions that must leave some of you guys slapping your foreheads. And I hope this isn't one of those questions.
We have a collection of work issued GP328's (Motorola) and we also use the uv5r for our own closed channel conversation. Using a counter we have ascertained the work frequency and entered into the baofeng. We can tx motorola==> Baofeng but when we try the other way the motorola light flashes like it is receiving but we get no sound. Baofeng==> baofeng works fine.
Have tried all the S codes on menu #17 with no luck. They appear to be on simplex.. any thoughts?.

The Motorola radios are set to require CTCSS tone or DCS code to open thier squelch. They also transmit this tone/code to unlock the squelch of the other Motorola radios so that they can communicate together.

The reason that the Baofeng receives is because you have programmed no receive tone/code. As I have said many times, programming no receive CTCSS tone and no receive DCS code always works.

You have either programmed no transmit CTCSS tone/DCS code (likely) or the wrong tone/code has been programmed.

Menu 17 (S-CODE) has nothing to do with your problem. It is menu 12 (T-DCS) or menu 13 (T-CTCS) that you need to address. My guess is that you don't know if the Motorola radios are using CTCSS or DCS and more importantly the tone or code that either would require.

What you need to do then is visit the Miklor.com website for the UV-5R and review the "Scanning for CTCSS and DCS Tones" page. It explains how you can use the UV-5R to read the t

If that is the case (MURS band), then no, this would not be the radio for that, as it is not FCC certificated for that band.

If his employer is ok with him using the radios on their licensed band, there is nothing illegal about using a UV-5R on a Part 90 band.

Seems like this group got out of hand. Use to get great info on the UV5 radios.Now it seems it's just a bunch of people arguing the legality of the radio and a lot of so called smart hams,are misinformed about the rules themselves. Remember guys this is a comercial radio and not just for ham bands. :-)

Gary,

This thread is about using a UV-5R with a group of Motorola GP328
"Professional Portable 2-way Radio" units used at work. There was nothing
mentioned about Walmart or MURS.

This is a perfectly legitimate use for the UV-5R, and being so, I make the
assumption that the existing use of the Motorola radios is legal. There is
no way we could require everyone to provide proof of licensing for their
intended use of the UV-5R before we will answer their questions. Especially
since some uses of the UV-5R require neither.

Within five miles, the weather radio works fine, and sometimes the police band does work. Just depends on who's talking. I'm thinking it may be the antenna/attenuation.

Subject: Re: [baofeng_uv5r] Re: ABSOLUTE and complete new ham, question about a step by step pro

Way more than 80% of the Baofeng radios that I've seen (with user's complaining they must be broken) end up being either poorly programmed by the end-user, or they simply don't understand the way their radios really work.

I've even seen some folks complain that they can't get the same frequency that their friend's Motorola TRBO digital radio gets, not understanding even the basics of analog vs. digital, not to mention how many times folks turn on PL or DCS on receive and then wonder why the little light comes on but they hear no audio.

I can understand having a technical issue with folks that always buy their electronics at the local super-box warehouse store, but some of these folks with call signs really should know better, or at least google a possible solution first.

On Thu, Aug 1, 2013 at 10:31 PM, Peter Cal <pc2053@gmail.com> wrote:

How far a way are you from the area your trying to receive ?

Have you tried resetting the radio ?
Can you normally receive the US Weather ?
Did you try contacting another person who has a scanner to find out if it's possible to receive where you are ?
Did you try going to Radio Shake and try there scanner or talk with someone there if your not able to find someone with another radio ?

Have you manually tried to scan on the unit a small range of frequencies based on RR during the day to see if there is any active channels.. Rather than typing in all that information ?

I would also if you have it try another antenna /// if all this fails.. contact your vender and ask for a return if nothing is receivable

The way you describe the receive almost like CTCSS (DCS) the receive is turned on with a PL on rx.. reset using the menu on the radio. Don't use channel 0.
Look through the menu with default in and check that rx is does not have a PL turn on..but the light will also turn on if the squelch up high. Turn down low 1 or 2 cause that can also give the same effect with the green light going on and off.

If all else fails contact seller you purchased from. Good luck.. try these suggestions and let us know if anything helps solve your problem.

Thanks

there is a good chance that your local police use trunking which means that they automatically hop around on different frequencies in order to assure efficient use of the channels that they are assigned to.

In my area they have gone digital except for ambulances and volunteer fd so there is not much to hear except hams and the weather channels.

have fun with the new radio, its probably ok. Once you get an understanding of how it can be configured you'll like it.

ck the files area for lots of good info

From: n7kuw
Topic: 31947 Message: 31947

My oldest UV-5R (version 251) has suddenly stopped producing any audio output, either through the built in speaker or using a speaker mic attachment. No beeps, no voice prompts, no RX audio, no FM radio - no audio at all. It certainly is not a CTCSS/DCS issue.

I've tried cleaning and "exercising" the speaker jack using contact cleaner and repeatedly plugging in and removing the speaker-mic. No change.

I took the radio apart, but see no visual evidence of a problem around the location of the speaker-mic jack. The wiring from the PCB to the internal speaker is intact.

I searched this message base, but did not come up with anything that might help. Any suggestions?

Thanks in advance,
Carl

There might be a corrupt memory byte that causes audio to be muted.

Do you use CHIRP? Install it if you don't. When you have it installed and working. Download and save the current image to a file for backup purposes.

Then download the 'reset' file from here that matches your firmware version.

http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/

Upload the file to your radio and see if speaker audio is working again.

If that fixes the problem, then email the backup file to me. I would like to look at it to see if I can determine what changed to cause the audio to be muted. uv5r [at] kc9hi [dot] net

Also load the 'reset' image and your 'backup' image into CHIRP so you can cut and paste your channels from the 'backup' tab to the 'reset' tap. You should also compare the settings tabs so you can set the 'reset' tab settings to match the 'backup' tab settings so you can upload the repaired image to your radio.

If the above doesn't work, it must be a hardware problem.

Jim KC9HI

31950. Take apart battery or battery eliminator

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-03 00:29:59 UTC
From: Gene Robertson
Topic: 31950 Message: 31950

Hi guys,

I have a couple of these radios which work great. I purchased one of the 12 battery eliminators but it heats up too much and shuts down after only about 30 seconds of transmitting (at 5 watts).

So, I am wondering if anyone has taken either the battery eliminator or the standard battery apart. Is it simply a matter of a gentle pry at one of the edges or is it glued/ultrasonic welded.

I would like to build my own 8volt eliminator but need to get the battery apart first...

Any help appreciated.

Hi

I'm new to all this. Anyway I purchased a UV5RE and wiped it clean.

I now need info regarding how to install and/or find the files on this site to encode all Australian channels and repeaters.

I have the software and it's installed and running.

I have found links to the Oz files but am having issues opening it as it is a Dat. File.

Please could anyone help and provide knowledge of the best program to open the Dat. File and if possible a "Walk Through" on how to add the data to my UV5RE Radio (via VIP software)

Thanks everyone.

If no one can provide a detailed walk through I will "once" completed post a How To Walk Through.

Cheers

31952. Downloadable .img files

I got my license about four months ago and got my first HAM radio 2 days ago. The ever-popular BaoFeng UV-5R.

I'm using the CHIRP software and had a thought. Is there a place to upload/download profiles (i.e. .img files)??

There probably wouldn't be anything for my area. I live in the High Desert in CA so it's kinda sparse. I figured, in a dense area, a lot of people could be using the same repeaters so why not just upload a proven working profile for others in the area to use with their radio.

What do you think??

If anyone does have a profile for the Phelan area (west of Victorville), please post it.

Thanks!

Thanks for the suggestions Jim. That did not make a difference, so it appears to be a hardware problem. I used Chirp daily-20130301 (which I already had). I may try to dig deeper into it if/when I get some time. I've got 3 UV-5R (2 now that work), on top of a quantity of other radios, so this is no big loss. As another person noted, now I've got some spare parts.

I'd think with RepeaterBook built in to Chirp it would do away with any need to share chirp files. You can find all of the frequencies in your area (139 of them total by my search) by going to Radio > Query Data Source > RepeaterBook.

I was wondering if anybody has tested this in rough country? Mine seems to pick up only the weather station, nothing else clearly with any regularity. I am in Lexington, KY.

hello,
I also have the uv-5re radio...You can check out the miklor website for some great info...but I learned how to manually program mine from reading this blog. http://wp4aoh.blogspot.com/2013/01/uv-5re-photo-1-baofeng-uv-5r-ia-multi.html he explains manual programming in great detail with examples.you will need to look up the repeaters in your area to get the frequencies and weather or not you need a tone for transmit and receive .the miklor sites has the info for the programming software and cable drivers.hope this helps.

ricky

Have you tried Google ?

Just look for UHF radio or PRS

Or - they are the same as New Zealand

http://www.uhfcb.com/NZ-PRS-Channels.php

You will need to set the radio menu 5 (WN) to N (Narrow).

31959. Manual Frequency Entry Problem

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-03 09:41:32 UTC
From: alan.hulme@talk21.com
Topic: 31959 Message: 31959

I can manually enter a frequency from 400 upwards by entering 6 digits off the keyboard but when I try it with a frequency from 100 upwards when I press the 6th digit on the keyboard to enter the last element of the frequency the radio says cancelled and reverts me to the last 100 series frequency I was on.

What am I doing wrong?

Tried btoh 2.5KHz step and ensuring I'm in 100 band and neither solves the problem.

Thanks for the suggestions though

Alan,

It sounds like you are outside the band limits. The standard factory band
limits are...

VHF 136-174 MHz
UHF 400-520 MHz (see note)

Note: Older radios were set to 400-480 MHz but can easily be change to
400-520 MHz using software the factory or CHIRP software.

Let's make things even more complicated. I have a 5/8th phase mounted above a 5/8th. The bottom 5/8 is the driven element the top 5/8th is phased as a director to flatten the doughnut even more. The array is mounted 40 feet above the ground. I live on a BIG Midwestern plains hill, 700 feet above sea level. 360 degrees around me the ground is flat level and lower than me.

This is perfect for my needs but may be useless for anyone else. So sometimes the best antenna is very personal

On 7/29/2013 9:14 PM, John H. Guillory wrote:
> Since you read all the books, I will not bother to go into the details of how a ⅝wave has a higher take off than a ¼wave. I also won't bother to mention soil condition affects antenna as much as height. I assume you already realize the obvious that some folks could put up a ¼ wave at say 200ft up where a ⅝wave may not be feasable due to a tree, power line, or another antenna. That same location might not be suitable for flat top dipole meaning it might be a person's only options would be a really high ¼wave vertical or a full wave dipole mounted flat top much lower than ¼ wave, obviously you would pick the di pole. As someone else put it, antennas are not an always this or that subject. Many factors affect it.

Hi All
Am in the UK (Cumbria) and have just bought a couple of UV-5R's and tried running the program on my PC and my Mac using original software and Chirp for 2 days, was pulling my hair out till I read about the radio end of the usb plug, "push the plug in hard till you feel a click" 1st you think its in then give a firm push and its in with a click.

Ran the software and no problem on the PC or the Mac.

DO THAT FIRST BEFORE ANYTHING ELSE it may solve your problems and stop you wasting days!!!!

I purchased the Baofeng speaker/mic accessory and I must say that it performs very well, especially while driving in the car.

I noticed that where the cable goes into bottom of the unit, there seems to be a female mini phone plug. Does anybody know what this is for? Perhaps an external headphones or speaker? And is it a mono or stereo phone plug?

Thanks,

Gene

That got a few local hits. Thanks!!

I'm a complete noob. I've only had my HT for about 4 days and it's my 1st HAM radio.

Two things.
1. Only a few of these have tones. (147.120 (CS/91.5) K7GIL OR 447.000 (136.5) KC6OPU) Some just have "CS" (146.115 (CS) K7GIL). Shouldn't there be a tone on all of them or do I just leave DUPLEX on NONE?

2. From what I've seen so far, for the most part, 70cm seems to be (-) and 2M (+) but I know that isn't always the case. Should I just go with that convention and see what happens?

Not all websites have complete info on all repeaters. Repeaterbook has more info for example and is a common source for repeater info.

It also has a proximity search so might be better than the first link I sent.

http://www.repeaterbook.com/repeaters/prox.php

k7gil on 146.1150 shows 91.5 tone here.generally the same place will use the same tone on all repeaters.

http://www.repeaterbook.com/repeaters/details.php?state_id=06
<http://www.repeaterbook.com/repeaters/details.php?state_id=06&ID=468>
&ID=468

kc6opu shows a 136.5 tone - but the comment on here says it was sold and is off-air now

http://www.repeaterbook.com/repeaters/details.php?state_id=06
<http://www.repeaterbook.com/repeaters/details.php?state_id=06&ID=1035>
&ID=1035

Duplex has nothing to do with tone - a tone is only provided/necessary to open up squelch on whichever end that wants to keep random people out.

Duplex in Chirp should match whatever the repeater wants -- +/-

And in case you didn't know standard offsets are 600Khz for VHF and 5Mhz for UHF.

No. But if you use CHIRP, you can select your favorite broadcast FM channel and then download your channels and settings to CHIRP. Save and use that as your main image. Then every time you upload that image, your favorite channel will be preselected whenever you switch to broadcast FM mode.

In the UV-5R series, no. In the B5/B6 series, yes, up to 16 FM channels.
Haven't got a UV-85 (yet), so can't help you with that one.

Yes, it's true that the UV-5R series units are Part 90 certified, however MURS and FRS/GMRS are NOT within the Part 90 certification. You can certainly program a UV-5R (and many other radios) to work on the MURS and FRS/GMRS frequencies, you are just not legally able to transmit there using a Part 90 certified radio.

Larry,

Could you send me some details on your antenna setup? What are the dimensions and construction, and what is the phase? I need something light to mount on top of my tower for FM work. Is your array vertical? Is it commercial or home-built. I will appreciate your suggestions. 73

The antenna is a TRAM Model 1400. You can see it at Palmetto Antennas.
That is where I bought mine. Unfortunately they are out of stock at the
present time, but I have seen it at other web sites. Just do a search.

http://www.palmettoantennas.com/vhf-base-station-antenna-ham-2-meter-murs-fir2.html

It is about ten feet tall and weighs about eight pounds. It is just for
VHF and can be tuned for 135 - 174 MHz. It comes with very good easy
instructions for how long to make each section slide into one another
for whatever frequency you need it tuned to. But be aware it does not
tune well on UHF. It is not designed to tune up to UHF.

I have had fantastic results with it.

You asked about antenna phase. Much like a yagi beam antenna where the elements are the correct distance and size to see the radio wave in the correct phase phase to do what they need to do. The reflector element behind the driven element "pushes" the wave forward, while the director in front of the driven element "focuses" the waves to go forward and not to the sides.

In my antenna the 5/8th wave antenna is much like a 1/2wave with a 1/4 wave above in the correct phase to reflect the waves down into a doughnut rather than a balloon. The second 5/8 above that squashes the wave into a pancake rather than a doughnut.

This is a much simplified explanation, but I'm sure you get the idea.

How does this compare to other bases like the Diamond X50? I have read conflicting reports on the diamond, some love it, some say it is poorly constructed.

I can't decide between installing in the actic vs outside on a 20ft rohn tower I would go outside for sure, but I would have longer feedline.

Interesting I have found some dual bander beams are cheaper than a vertical- never seen that before. Suggestions welcome.

Thanks ,

I also won't bother to mention soil condition affects antenna as much as height. I assume you already realize the obvious that some folks could put up a ¼ wave at say 200ft up where a ⅝wave may not be feasable due to a tree, power line, or another antenna. That same location might not be suitable for flat top dipole meaning it might be a person's only options would be a really high ¼wave vertical or a full wave dipole mounted flat top much lower than ¼ wave, obviously you would pick the di pole. As someone else put it, antennas are not an always this or that subject. Many factors affect it.

31994. Newbee problem UV5RVIP software download

I admit to being a Newbee to the BaoFeng radio so I do need some help. I have searched the past posts but cannot find an answer ... so here goes.

When I try to download the UV5RVIP software to my computer running Windows 7 .... the VIP program flashes on the screen for just a part of a second ... then nothing.

I have tried several times and even re-booted the computer to no avail. A friend said he thought the problem might be with Windows 7 and the possibility that the VIP program is intended for Windows XP.

Any help would be greatly appreciated

You might have a cable driver problem. Look it up in the user guide.
The link is bellow.

The VIP software "should" work fine with your Windows 7. I use Win7 64-bit here.

The VIP software for BFB291 firmware and above (v12.07.25) flashes the screen when it is launched as part of the serial port detection routine. If it continues to flash, then you don't have a suitable COM port available. It will continue to flash until is see a suitable COM port (ie: USB cable gets plugged in) or until it finally times out, whichever comes first.

If you have a USB programming cable, and assuming it isn't defective, the most likely cause of the problem is the wrong driver is installed. Other possibilities could be the cable isn't plugged into the USB port properly or the assigned COM port number is out of range (higher than 16). If you are plugged into a hub, you might try plugging directly into the computer.

Because of the USB-to-serial chip in the programming cable, the cable requires an older driver to function properly. Windows 7 automatically installs the latest driver, and it won't work with the most common chips. Dealing with the wrong driver is as simple as visiting the Miklor.com website and following the advice on the Drivers and USB Cables page. Once you get the correct driver installed, keep using the same USB port. Plugging into a different one will cause Win7 to create another virtual COM port and thus install the latest driver again.

If the software loads fine, and the issue is actually when you are trying to read from the radio. Then make sure you have the correct software installed. Radios with BFB291 firmware and newer (most new radios) requires the version mentioned above. Radios with firmware prior to BFB290 requires

v12.07.06 to be compatible with the radio.

If none of the above solves your issue, then you might as well try CHIRP (links to it are on the Miklor.com website). I'm not aware of anything that VIP can do to program your radio that CHIRP can't. And there several things that CHIRP can do that VIP can't (but I do have and use both). But just like VIP, it will require that you have a properly installed and functioning programming cable.

From: Bill Storey
Topic: 31713 Message: 31998

The antenna Larry mentions is similar to the Ringo Ranger. If you live in a flat area and want to minimize your distance, or if you are high relative to surrounding terrain, this gives you a lot of gain. This one uses 3 phased 5/8 wave antennas stacked.

http://www.cushcraftamateur.com/Product.php?productid=ARX-2

Living next to a very tall hill, I need the J-pole to get a higher radiation pattern in order to maximize diffraction to the repeaters out of line of site on the other side of the hill.

The "best" antenna is really dependent on your QTH. I carry a 1/4 wave and 5/8 wave on my vehicle and the "best" depends on the path to the nearest repeater.

Bill

Hi Phil,

I've never tried it, but when you select File -> Import the file type can be changed to "Travel Plus Files (*.tpe)" so I would think ARRL Travelplus files could be imported directly. Try it out and let us know.

From: John
Topic: 32003 Message: 32003

Hi all :-)

This might sound a bit odd ???
What it is that I am looking to do, is set one of my radios to VOX, as my sister has got a house that she is not living in as yet. But she has work men in on a day time, but on one at night. So my plan is set a radio in the house that is getting the work done to it, and have the other radio at my home location (only two streets away) so I will know if anyone has come in over night.
But when I set my radio to VOX, it was NOT that sensitive to pick up any sound. Well in saying that, id did work when I hit a hammer aganest a door. So I would like to know if anyone knows a simple way to increase the sencitivity of the VOX opperation ????
I was thinking of adding a larger mic into the mic jack at the side, but I do not know how good that it would be.
So anyone that can help me, then I would be a very happy man.

Bye from John

Hello; your problem may be as simple as using menu 6 ABR(display illumination), it has settings of off/1/2/3/4/5 seconds in your case it may be set to off.
The numbers mean how many seconds it stays on before turning off. it turns back on when any operation is done or a signal is received by the radio.
Menu 29/30/31 are set the color of display check each one and set to the color you want , make sure there not set to the OFF position.
Enjoy the radio , N3GWT Charles

32005. Wiring to/from iPhone

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-04 23:55:52 UTC
From: Rob Gendreau
Topic: 32005 Message: 32005

I mentioned before I got the radio working with PocketPacket insofar as SENDING FROM the iPhone TO the radio.

Now I wanna RECEIVE FROM the radio TO the iPhone.

The problem is essentially the PTT circuit in the radio; if the sleeve (S in TRS) of the 2.5mm plug is connected to S of the 3.5mm plug you activate PTT.

On an iPhone, which has a TRRS plug, the 3rd R (ring) is a grd, and maps to the S of both plugs if you get any standard adapter. So it becomes the shared ground (sleeve) on both 2.5 and 3.5 plugs when broken out from the iPhone.

How could I wire a plug so I wouldn't get PTT?

Here's the standard iPhone diagram for its plug:
http://www.ediy.co.nz/use-ipod-touch-iphone-with-skype-xidc55676.html

Mark,

I am using chirp on Linux Mint without problems. I did have to shave the radio end of the cable down to get it to seat properly.

Can't say for sure if this is illegal in the UK, but I think unattended VOX operation would be illegal in the U.S. (at least on any amateur radio frequencies that the radio could be used on, since no control op would be present). VOX sensitivity can be adjusted (in theory at least, via the keypad) but I'm guessing that what it would really take is more microphone sensitivity which means opening the radio up internally.

Assuming for a moment that what you are trying to do is legal in the U.K. (basically using the UV-5R as a replacement baby monitor), and that you have a frequency (or group of frequencies) that this would be legal to do, I'd suggest that you first place the radio in an area where your sister can talk in a normal voice and see how far you can hear her first. Two blocks for some in America equals two miles, which isn't going to work on FRS frequencies at .5 watt.

Date: 2013-08-05 01:22:21 UTC
From: Earl
Topic: 32015 Message: 32015

Good day all

Have been enjoying my new UV5-RE Plus radio and annoyed by software - computer issues. I have been active in ham radio for ~50 years and this is HT # n+1 -- but there is always something new to learn something new to learn!

Could not find my problem using any search terms that came to mind. Apologize in advance if issue described below has already been discussed.

Running Win 7 Home 64 here. Programming cable shows as having a good chip and driver. The factory program only worked once (so far) and I managed to write to the radio but not read or be able to save my table of frequencies.

Chirp (2nd August version) lets me read the radio and appears to be a better program, but it causes the radio, while connected, to intermittently transmit, without any action on my part. With this going on I can't proceed with programming.

Would greatly appreciate hearing any ideas on this issue.

thanks

Earl VA6TJ

Dr. Edison Fong (professor of Radio Frequency at U.C. Berkeley) is one of the premier Ham Antenna designers around. He will actually take time out his busy day to personally talk to you on the phone BEFORE you buy one of his very inexpensive antennas.

I have bought both of the following and have one in my attic with LMR-400 running between it and my UV-5R and it will reach out and hit any of the repeaters around the Dallas area on 1 watt. I take the roll-up antenna with me on Scout camping trips and road trips. If outside I pull it up a tree or inside I use a push-pin in the loop that's provided and hang it up on a motel wall or window frame. It comes with a cable already attached and a connector that will fit your HT.

Here's the sites for more info:

* http://tinyurl.com/m4vh4ga
* http://tinyurl.com/jwzjth2

email or call him and he will sell you both antennas for only $50 (shipping included)

For more info on Dr. Fong or his antennas just Google his name or here are some reviews:

* http://www.eham.net/reviews/detail/6376
* http://www.gobookee.net/antenna-theory-edison-fong/

I will also upload to the file section of this user group two papers that he published about those particular antenna designs.

I hope this helps

Fletch,
I am in no way dissing the recommended antennas, but you can search on j-poles and look at the different designs you can build very easily. I have made three so far (2) 2m-440 and a 6m. All three are made with 1/2 inch copper tubing and fittings from local big-box stores. they require a hack saw and a cheap propane torch. A 1-day job. The home made versions are more broad-banded and out perform the commercial stuff. Feel free to contact me by direct email if you have questions.

Chad and others

Many thanks for the prompt replies. It is not the cable plug length,or the driver etc. I tried reconnecting the USB cable but this does not do the trick.

The CHIRP program is reading and writing to the radio without difficulty - except for the spontaneous PTT activation. The cable, attached to the HT but not the USB port does not activate the PTT. When I plug in the USB the small LED just below the VFO/MR button flashes green once and then about 1 min later it starts flashing red, transmitting a burst each time, then after about a further 10 seconds locks up in transmit - at which time I turn the radio off.

Curiouser and curiouser! (never had this much excitement with my Kenwoods, Icoms, Wouxuns and Yaesus)

I have a programming cable that causes all of my radios to transmit. I've got plenty of other cables so I don't use it. But if I did, I would use CHIRP and do all of my programming on a TX inhibited channel. Just be sure to set the following Work Mode Settings as follows:

VFO/MRO Mode = Channel
MR A Channel = {TX inhibited channel number}
MR B Channel = {TX inhibited channel number}

That way you make sure that the TX inhibited channel is still selected when the upload to the radio is completed.

I carry a 1/2 wave (Comet SBB-5NMO - 38" tall) and a 1/4 wave (Diamond NR72BNMO - 14" tall) in my vehicle. I use the taller Comet out "on the road" for maximum range, and the shorter Diamond around town due to tree limbs overhanging the streets.

Takes only a few seconds to switch them.

Yes, this radio will work, many of our local walmart employees use this radio, they pretty much all have the UV-5RA's as far as what I have seen being used. The frequencies they are using are 154.570/is blue dot and 154.600/is green dot. Hope that info helps.

"so ignoring the LEGAL part of the idea can this radio work"

- that's precisely why some on this forum have an issue with supplying the information, because so many ignore the legal use portion of this radio.

No; the vox sensitivity is designed for operation close to the
microphone, it's not to pick up any sound in the room. (And such
operation is probably against regulations).

Assuming that you really need this type of monitoring, you would
be better off with some type of cordless baby alarm; some of
these easily have the range to reach your home.

Absent a VOX sensitivity control (which I'm pretty sure the UV-5R doesn't have), you can accomplish your objective with a stage of amplification between the microphone element and the audio input. Details of how to accomplish this "are left as an exercise for the reader."

32038. DTMF codes - erratic behavior ?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-05 12:05:56 UTC
From: cnabski
Topic: 32038 Message: 32038

I have recently received my transceiver with BFB297 - BFB307 (in Chirp).
As far as I can tell the trx is sending and receiving fine but I seem to have an issue with the dtmf tones.

When I try a to connect to a reflector on a local irlp it doesn't connect or (when using other nrs) connects to the wrong node. It seems like the repeater is not able to decipher all tones correctly. (it does work with a dtmf tones generator of a smartphone holding closely to the mic f.ex.)
When testing with another trx near the mic of a pc with a dtmf decoder the pc does seem to decode the tones but not consistent. So it looks to me that the tones are not "pure".

I wonder if someone else has the same issue and whether I should ask for a a replacement (if possible) ?

32040. G'Day From Straya and got a UV5R+

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

From: Erik
Topic: 32040 Message: 32040

G'Day!

Thought I'd jump on in to the Baofeng owners pool, crack open a coldie and enjoy the atmosphere. I got my radio (UV5R+) today a couple of hours ago in the post and I gotta say that it ain't a radio the newbie can just pick up an' use - as most of youse all know.

It's far easier to program these with a computer and the cable in my opinion. Took me only 10 minutes to get the drivers and CHIRP installed and operating, and had the radio on frequency mode restricted to the legal frequency range for Aussie hams (144-148 on VHF, 430-450 on UHF) within minutes.
Learnt a couple tricks on channel set up with CHIRP such as TX inhibit - set up a split duplex channel and send the radio's offset freq OOB (out of band) - preferably up into the GHZ. My mate's favourite freq is 1666.666666 to do this on.

Still learnin' new things about this radio every day - downloaded a bunch of help files off the net and will be usin those as I toy with said radio. Tryin to get it to scan in dual watch mode too - if anyone can tell me how that's possible would be much appreciated.

Thanks,

Erik

John

As mentioned by others, I believe this would be strictly illegal on ham frequencies almost anywhere on the world -- maybe if you license a commercial frequency or you could check the FRS or GMRS regulations ? I believe a wireless IP cam with microphone would probably provide better security. However your idea is not without precedent and years ago a ham friend did hide a 2m xmtr in his car and wire it to the car alarm. If the alarm was activated it transmitted any audio from inside the car on a seldom used 2m simplex frequency... that was in the days before APRS

From the technical side, It is easy to wire up a mic pre-amp run from a 9V battery that should bring audio up to the VOX level -- but I am not sure how intelligible conversation would be with all the background noise.

have fun

Many thanks. Just the answer I was looking for!

I will try a friend's cable just to confirm and perhaps make up one of the RS 232 cables.

There’s a lot of options for DTMF that aren’t easy to understand and don’t seem to be used around here on the Baofeng UV-5R. I’ve tried and can not get my DTMF codes to work with my local repeater. No clue what to say, though I haven’t tried with a tone generator. Thought about it, but haven’t tried....

Hi :-)

The distance from my sisters place to my place is less than 1/8 of a mile, so the TX would not be a problem. The frequency that I use if licence free in the UK, and I know for a fact that in the part of town that I am in is only 2 users. It is a headland on the coast, it has only one road that you can get on it by. The 2 users use channel 3 of 8 (boyfriend and girlfriend) so I set the radio to TX on channel 6.
As for walking about the room and talking, it is OK if you are a few feet from the radio, but after that it tends to sound a bit dead. I have made the mic hole a bit larger, that was one of the first things that I done. But this is still not doing the job :-(
As my sisters house is empty at night, you not hear much sound, so I would like to be able pick up the sound of the door been closed. Well let's say it how it is, someone wanting to rob the place of copper pip and new boiler would make some noise.
Well now you know what my plan is and what I am trying to do. So I hope you know a simple fix for me.
Thanks for any help that you can give to me.

Bye from John in the UK

Subject: Re: [baofeng_uv5r] VOX ???

Can't say for sure if this is illegal in the UK, but I think unattended VOX operation would be illegal in the U.S. (at least on any amateur radio frequencies that the radio could be used on, since no control op would be present). VOX sensitivity can be adjusted (in theory at least, via the keypad) but I'm guessing that what it would really take is more microphone sensitivity which means opening the radio up internally.

Assuming for a moment that what you are trying to do is legal in the U.K. (basically using the UV-5R as a replacement baby monitor), and that you have a frequency (or group of frequencies) that this would be legal to do, I'd suggest that you first place the radio in an area where your sister can talk in a normal voice and see how far you can hear her first. Two blocks for some in America equals two miles, which isn't going to work on FRS frequencies at .5 watt.

Hi John.

No she has NO Internet, as she has not even got mains electricity :-(the house was left up for sail for the last 8 years, every thing in it is what was in when the house was built in 1951, so every thing needs to be replaced. As it has lead water pipes and the electrics in it is shocking (sorry for that pun). So the workmen have been putting in new everything, but it only takes one to rob the place to set the job back months and increase the cost. So that is why my radio thing sounded like a good thing up to the point of it now working :-(

John,
The UV5R is known for having low audio for use in an industrial environment.
Even with the VOX sensitivity wide open, I don't think it will do what you're looking for.

If she had an internet connection there, I would recommend an IP Security camera, but if she hasn't moved in yet, I'll assume that's not a possibility.

Absent a VOX sensitivity control (which I'm pretty sure the UV-5R doesn't have), you can accomplish your objective with a stage of amplification between the microphone element and the audio input. Details of how to accomplish this "are left as an exercise for the reader."

32054. Antenna Gets Hot At The Base Issue

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-05 17:34:54 UTC
From: ww
Topic: 32054 Message: 32054

All,

I have followed with interest concerns about the UV-5R stock antenna heating at the base during hi-power transmissions. But I have yet to hear reports of premature failure of the final amplifier transistors because of this. Has anyone experienced failure of the finals in a rig using the stock rubber duck? Also, are people not reporting failure of the rig because of the low cost of replacement?

In addition, has anyone who has an antenna analyzer measured the SWR of this antenna across the 2 meter band? 440?

Thanks.

Are you accomplishing the comms you want already with the stock duck?

If not - but you can hear the station, but they say you are scratchy, then an antenna improvement (to one of those 17" thin wire ones ... or a Smiley 270A Female SMA model) should make your comms much better.

But if you are not hearing things at all, then you may need to re-think things entirely ... like a rooftop antenna ... or other equipment ...

As you learned while studying for your amateur radio license, these 2M/22/440 comms are mostly "line of sight." If it is a straight shot to your "target," then you'll probably make it (within reason) with your HT. Heck, I regularly work a station that is more than 500 miles away from me - at 2W TX powrr and a little better antenna. That station, of course, is an amateur radio satellite ... truly a great demonstration of "line of sight." But put that exact same equipment setup in downtown Los Angeles, and I might not be able to work someone just a quarter-mile away!

A true waste of anyone's time, IMHO. (grin)

Yes, I have tested HT stock ducks, and replacement/improvement antennas. Just know that most stock ducks are about NEGATIVE 2 to NEGATIVE 3 db gain. So your 5W HT is really only putting out about half that power ...

Since SWR can vary wildly with how you place the antenna and your arm (which is typically the way it would operate since your body is the other half of the antenna.put it on your hip and SWR goes nuts).

I just did some simple testing for fun. Holding the antenna approximately like you would in front of your face minimum SWR occurs at ~147Mhz at 1.4SWR and 137Mhz is at 3.0.

Put it on my hip and minimum SWR is now 1.5 at 137Mhz and 147Mhz shows an SWR of 3.0 so the behavior flips around.

Your body-mileage may vary J

Conclusion: SWR on a hand-held antenna is pretty funky..as K6LCS implied.better done on a base station antenna though I have done testing on numerous hand-held antennas to find out where minimum SWR is.

A 460 Ohms resistor is not a standard value, either 430 or 470 Ohms
would be the nearest standard EIA 10% values.

http://www.logwell.com/tech/components/resistor_values.html [1]

Why
the resistor? To prevent shorting when inserting the connector?

Thank you, Michael,

Your impromptu test does yield some interesting information ..... that the SWR isn't ridiculously out of sight. Based on what you show, it looks like the SWR is probably in the range considered safe for operation in the 2 meter band. It looks like the heating issue may be unrelated to SWR.

I still wonder, though, if any rigs using stock antennas have been plagued with failing finals.

32061. Audio/modulation level mod (correction?)

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-05 18:46:10 UTC
From: w1pa
Topic: 32061 Message: 32061

Please sanity check me.

Images are here:
http://groups.yahoo.com/group/baofeng_uv5r/photos/album/1083113189/pic/list

I did the UV5R "single cap" modification:

http://www.arifidenza.it/forum/topic.asp?rand=5334240&whichpage=1&TOPIC_ID=187377\U0005ff5a

...but noticed it only effected the internal microphone, and not an external microphone connected to rig, based on on-the-air tests.

I looked at the schematic and noticed that the symbol for the mic connector is drawn wrong .... 1 and 2 are swapped, and 3 and 4 are swapped, to properly disconnect the internal mic when the external is inserted.

Since in this mod the cap is wired directly to the connector, as- published I think the cap only bypasses the internal mic when connected to the right hand pin. When the external mic is connected, the cap is taken out of the circuit. If you move the connect point to the other pin (#1 in the image), the cap is there for both.

I have included the corrected schematic (see yellow shaded area) and have an image of what I did.

Better audio on internal AND external, and does not effect the USB programming on my rig.

Does this look right?

> I still wonder, though, if any rigs using stock antennas have been plagued with failing finals.

You mean, you are wondering if a company designed and manufactured and distributed a handheld radio model that would burn up if one simply used the included accessories?

I can only cite as evidence my employment with the U.S.' largest amateur radio dealer for a couple years - years when there were threads about "blown finals" on FT-817ND and during the introduction of the FT-60R (as well as several other radios). And in my direct conversations with Yaesu and with clients, I never encountered a valid case of "blown finals" by owners of HTs. I remember one FT-60R that I sold to a client that was "frozen" - he couldn't get it to do a single thing. I immediately replaced it (delivered it to him to his home after work one night, actually), and all was fine.

But, then, I am a guy who owned an HTX-202, ran it on a vehicle's 12VDC with an aftermarket antenna improvement - and never encountered that errormessage that some did when using that combination of equipment.

No, this experience is not with Baofeng models. I write it just to point out that the Internet is a wonderful thing, but that unless an HT model is truly poorly designed, it is very difficult to "blow finals." When I last looked, MANY of the "blown finals" "reviews" came from folks who were not the original owners of their HTs - and they have no idea what kind of physical/electrical abuse the rigs may have endured by previous owners.

Bottom line of all this? Just use the rigs as they are. And try doing something some hams refuse to do: Turn down the TX power once in a while, and see if you can still accomplish your comms. By turning down receive volume and turning down your TX power, you can more than double the time between charges of your batteries!

Subject: [baofeng_uv5r] Re: VOX ???

John

As mentioned by others, I believe this would be strictly illegal on ham frequencies almost anywhere on the world -- maybe if you license a commercial frequency or you could check the FRS or GMRS regulations ? I believe a wireless IP cam with microphone would probably provide better security. However your idea is not without precedent and years ago a ham friend did hide a 2m xmtr in his car and wire it to the car alarm. If the alarm was activated it transmitted any audio from inside the car on a seldom used 2m simplex frequency... that was in the days before APRS

From the technical side, It is easy to wire up a mic pre-amp run from a 9V battery that should bring audio up to the VOX level -- but I am not sure how intelligible conversation would be with all the background noise.

have fun

Here are the instructions that I got from Bob, the author of the CHIRP Live CD.

---begin---
download the latest .tar.gz version of Chirp then:
open a terminal window and issue the following commands
cd \<your download folder>
tar xzf chirp-daily-20130530.tar.gz (change file name as appropriate for your downloaded version)
cd chirp-daily-20130530
./chirpw

Chirp should open then close Chirp and execute the following in terminal: **Note, if Chrip does not open, see below**

sudo python setup.py install
You will probably get a Chirp launcher under the "Other" menu

Now, plug in your cable and issue the following in terminal:

dmesg | grep tty

look for /dev/TTYUSB0 (or something similar) along with your chip name CP210x, that will be the port your cable is plugged into

in order to run Chirp as a normal user, execute the following from terminal: (if upgrading your install, you won't have to do this since you did it when you installed the first time)
sudo usermod -a -G dialout <your user name>

*** If Chirp did not work when you issued ./chirpw above, you need to install the dependancies:
sudo apt-get update
sudo apt-get install python-gtk python-serial python-libxml2

then go back to the instructions above and start with executing ./chirpw
---end---

Here's a known mod for the UV5R.not for the faint hearted.though the original mod kills VOX there is a solution to keep VOX at a higher level too.

http://www.gorhudson.com/gor/baofeng-uv-5r-modulation-fix/

This is on my to-do list.

I was looking at useing an arduino to control all the functions of the radio. I was wondering if I could use small reed relays. One relay for each row and one relay for each colum all tied to a common buss to simulate a keypress on the keypad. My other thought was to use CD4066 analog switches in place of the relays but am not sure this would work.

yep, it functions fine using just one of the grounds, i used the speaker ground as that is where my mic and speaker were hooked up in the original ptt earphone. the second ground had nothing going to it and just connects to the first one when you press the button.

Sorry about that, I checked and the correct value was 470 (look at the post time, haven't slept in 2 days, sick dog).

My main reason is that before adding them I was overdriving both sides. Radio to phone wouldn't properly decode packets 90% of the time, and no packets were being copied from phone to radio.

After the addition of the resistors, phone is displaying quite a few hits, and aprs.fi showed my track just fine. YMMV

32077. UV5R+ quirks and other info

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-05 23:23:47 UTC
From: Erik
Topic: 32077 Message: 32077

G'day,

Just while playin with the radio I found out the following quirks:
1. In channel mode if using CHIRP to program (latest daily build) and the radio has no frequencies

programmed into it it will show something like this mock up:
|---------------|
| 432.750 (126) |
432.750 (126)
(the top being A display, the bottom being B. The brackets around (126) signify the channel number.

Trying to enter a channel number manually will just default back to this exact display.
Transmit timeout can be set all the way up to 600 (10 minutes) with CHIRP.
The VHF/UHF transmit enable/disable near the VFO output mimic the nonfunctional options in the

Baofeng software so I just locked the radio down to the acceptable ham ranges in australia (144-

148MHz VHF, 430-450MHz UHF). If you have voice on and try to input a freq out of the VFO ranges once

you have them programmed the radio just reverts to the last valid frequency it accepts, if you have

voice on which I do and always will on every one of my radios, it says 'Cancel'.

Programming in a channel manually I do not recommend although it is possible. I just use the cable

and CHIRP. This is a radio I would not use to transmit. If you do wish to inhibit transmit on a radio

channel just set split duplex and either 000.000000 or 1666.666666 for the offset frequency. I use

1666.666666 myself personally, but 000.000000 apparently emits no RF therefore the transmitter finals

are not active. if anyone could confirm this it would be great.

Dual channel watch in VFO mode will do just that, watches for activity on both bands and will

activate the receiver on either frequency. In channel mode it will check for activity on any two

channels you select. You can of course choose to view the programmed channels by freq or name, when I

program a new RX only channel with transmit inhibit i use the onboard menu to change display of

channel to frequency so I can see that transmit inhibit has been set correctly.

I've turned the back light off, left blue LED on for receive, orange for TX. The green LED below the

VFO/MR button turns on when receiving, red for transmitting as well.

Squelch on VHF due to a firmware bug is no matter what the setting, 0.1uv. So on VHF mode, you can

either turn squelch all the way off to hear the classic radio hiss, or turn it onto '1' to pick up

the weakest signals. UHF squelch I've read up on and it works OK, I just leave it on '1' cause I

can't be bothered changing it around.

Another firmware bug I'm not sure is present in BFB307 is that when channel scanning, any channels

programmed with CTCSS or DCS tones below 136.1Hz or something like that are skipped right over. Not a

deal breaker as I never intend to use either of those features (or DTMF, ANI etc).

The orange CALL button for FM radio only works when you've changed the freq (in VFO mode) or a

channel (in channel mode) that is currently not receiving (backlight off and TX/RX LED not lit).
MON works as advertised, hold it down to open squelch, let it go to close it. Not sure what setting

to configure to disable the emergency call feature and only be able to use the FM radio, any input on

that would be greatly appreciated.

Have not had any issues with the base of antenna heating up when transmitting, but I'd guess as to

the cause - an improper connection with the antenna and connector which could mean it is either dirty

or faulty and the full RF is not getting out into the antenna. This is also why it is not recommended

to transmit without an antenna, reminds me of the days of the old radios where if you did key up the

transmitter without an antenna or a dummy load you could blow the finals. It's also why I remove the

antennas always before I program the radio, that way the radio does not receive anything while it is

being programmed.

In my case the Baofeng 'official' software could not read or write to the radio no matter which

version I downloaded and installed so I just used CHIRP instead and have never looked back.

Anything I've missed out here, feel free to reply.

Erik.

> I wonder if someone else has the same issue and whether I should ask for a a replacement (if possible) ?
>
I haven't tried DTMF tones on my radio yet but will experiment with them tonight using the speaker mic and a 3.5mm male to male cable in Audacity - first by using Audacity to generate a correct DTMF tone then see what the radio outputs in comparison.

If the tones are indeed off frequency then Houston we do have a problem. Baofeng still make a pretty good radio and I'm not taking points off them for DTMF problems, but as with every Chinese radio they do have their shortcomings...

You can not erase all channels. Once you delete the last channel, the radio
will perform a menu 40 (RESET) and channels 0 and 127 will be programmed
with the default frequencies. If you upload a blank CHIRP image, channel 0
will have the default frequency.

>
> Trying to enter a channel number manually will just default back to this

You can only access channels that have been programmed. If you only have
one channel, you're there.

> Transmit timeout can be set all the way up to 600 (10 minutes) with CHIRP.

If you set the upper band limits lower than the lower band limits in CHIRP,
the VFO is completely disabled.

The way you as supposed to disable TX on a channel using CHIRP is set
Duplex to 'off'. The way you are doing it is the way it was done before the
'off' option was available.

>
> Dual channel watch in VFO mode will do just that, watches for activity on

To test if a channel has TX inhibited no matter what the MDF settings is...
1 select the channel in the currently selected display
2 activate 'reverse mode' by tapping the [*SCAN] key (BFB251 and older
firmware requires TDR=OFF)

If the radio refuses to enter 'reverse mode' and you hear the TX inhibited
'bleep' sound, TX is inhibited.

>

VHF squelch was measured in BFB307 to have a range of .066uV to .170uV for settings 1 to 9. I don't know which firmware version this was actually addressed though

>

So far we haven't found a way to disable the emergency call button :(

But at least if you set menu 32 (AL-MOD) to SITE, the alarm won't go out over-the-air.

First of all I'd tune the radio to an empty channel/frequency (i.e. one not receiving) depending on whether you're in VFO or MR mode. If you try to push the 'Call' button once while the radio is in receive mode on a frequency or channel (i.e. you hear something out of the speaker and see a small green LED lit and/or the backlight is lit up depending on the backlight settings) it does not work. Tune to a quiet frequency then push the 'Call' button once and you should get your FM stations. Just note that if your radio receives anything on that quiet frequency you set while you are listening to FM, it stops the FM broadcast radio and goes back to receive mode.
To turn off FM at any time, press the orange 'Call' button once more. DO NOT hold it down.

If by 'Menu' you mean the CHIRP software menu, then just turning that option (FM broadcast) on, pulling out the cable and expecting it to work is not enough. You need to clone your settings to that radio with the program cable. the Baofeng UV-5R is a clone type radio which means you need to use the program cable, driver and CHIRP software to download the image from the radio, make a back up of that image incase further down the line for some reason it becomes corrupted in the radio, then use the image (NOT the back up version you stored elsewhere on the hard drive) with CHIRP to enable FM broadcast radio. Save that image.

Now that you have enabled the FM broadcast radio with CHIRP and told it to write that byte to the image, saved the image it's time to upload it to the radio:

1. Switch off the radio and remove the antenna.
2. Plug in the program cable into the computer (USB plug)
3. Plug in the program cable into the radio (radio plug)
4. Start the CHIRP software if you already haven't.
5. Use CHIRP to load your broadcast FM enabled image.
6. Use CHIRP to write the image to the radio. After the image is successfully written the radio should re-boot itself.
7. Remove USB programming cable from both computer and radio, switch off radio, replace antenna and then switch the radio back on. With the radio tuned to an empty frequency in VFO mode or a channel in MR mode, push the orange CALL button once and watch the display. If the image was written properly, then you should be able to tune up and down to your

favourite broadcast FM station.

If you have any questions do not hesitate to reply to this message and I'll do the best I can.

Erik.

Don't press the call button to long or it won't work and you run the risk of setting off the alarm. It needs to be a quick tap and there must be no activity on the selected VFO frequency or channel.

First of all I'd tune the radio to an empty channel/frequency (i.e. one not receiving) depending on whether you're in VFO or MR mode. If you try to push the 'Call' button once while the radio is in receive mode on a frequency or channel (i.e. you hear something out of the speaker and see a small green LED lit and/or the backlight is lit up depending on the backlight settings) it does not work. Tune to a quiet frequency then push the 'Call' button once and you should get your FM stations. Just note that if your radio receives anything on that quiet frequency you set while you are listening to FM, it stops the FM broadcast radio and goes back to receive mode.
To turn off FM at any time, press the orange 'Call' button once more. DO NOT hold it down.

If by 'Menu' you mean the CHIRP software menu, then just turning that option (FM broadcast) on, pulling out the cable and expecting it to work is not enough. Hello Group,

Question on storing settings into memories. I store the TX frequency into memory then I have to store the Receive Frequency into the same ch.
My question,
Is there another way to input both the TX-RX simultaneously.
73,
Mark

The FM receiver covers a lot of empty band space so make sure you are within 88 to 108, I seem to recall that there is a procedure for getting near the broadcast portion but don't recall how to do that.

Mark,

Here's how it works...

First you write to an empty channel with the RX frequency showing in the A VFO display. This writes the A VFO frequency into both the RX and TX registers of the target channel simultaneously (thus creating a simplex channel). If what you want is a simplex channel, you are done.

If what you are after is a split/repeater/cross-band channel, then you change the VFO to the desired TX frequency and write it to the same channel (updating the previous frequency in the TX register with the frequency in the VFO).

The only other way to program the RX and TX frequencies simultaneously is by using software.

It's not a matter of line loss. It's a matter of mismatch where all of the energy is not going into the antenna and might damage the transmitting components.

So, something no one has answered for me... on an HT, since there is no feedline, is SWR a big concern? No feedline, so no feedline loss?

Tried again with an irlp repeater.
On a repater with irlp. Connecting to the winlink reflector (nr 9100) does not work.
From my previous tests I remember that connecting to echotest (echolink) on another does work. So some tones (9's) seems to work on my particular transceiver.
An the connection to the irlp node does work with my kenwood (v71).

I am not sure if this issue is just with my trx or whether this is a general issue with this transceiver or rather this version (BFB307).

Thanks for testing anyway.

Maybe the DTMF tones are over deviated? Have you tried with BANDWIDTH set
to NARR to see if there is a difference?

So, Larry, are you telling me that high SWR does heat up the finals? Those guys saying it doesn't have been lying to me? Haha!

I always knew this. Use to see it all the time with R/C gear. Collapse the antenna, the final transistor heated up. Extend the antenna, it cooled off.

Hi Fletch,

Rohn makes a hinged tower base plate. You mount the base plate securely on a concrete pier, and then it accepts a Rohn tower section. When necessary, you can then tilt over the tower section to ground level.

When upright, the tower section must either be guyed or bracketed to a building. I would not want to mount a very tall tower in this manner, but it ought to be OK for one section if it's guyed or bracketed. The base plate is available from Rohn dealers. Here is one vendor:

I've only got the stubby antenna that came with my radio so far, but if I wanted something that looked professional I'd get one of those 30cm whips that just plug right into the radio off ebay, of course it would be a dual bander. I've also seen those 'car antennas' for it that are intended to be mounted on your car but I wouldn't get one of those due to the fact that any excess RF energy generated by the alternator or electrical components in the vehicle would reflect back into the transmitter, heating up the final transistor and shortening its service life. In short - my recommendation would be a simple 30cm whip antenna for the radio - easily found on ebay.

There is nothing to stop you from drilling new holes in the tower section to match the Rohn base plate. Another possibility is having a local welding shop fabricate a new custom bracket to fit the existing hole pattern in the tower section.

I don't think you'll have much luck salvaging the custom bracket embedded in 3 feet of concrete.

Thanks Rob

I already have some UV-5R radios. I ran across a discussion on the Parallax fourm about what I wanted to do.

http://forums.parallax.com/showthread.php/114711-Keypad-emulator

Yes I have seen and read about what Lior had done with his expierments and it is quite remarkable. I do think as you pointed out that the UV-3r might be easier and a better fit.

From what I have read the CD6066 or other varriant will probably work fine. I have also ran across a similar project that used a Arduino with 5V reed relays to control a cell phone. They used a common buss and the relays tied one colum and one row to simulate a keypress.

This is in my capabilities right now because I am just getting started with programing and playing around with the arduino board.

It looks like I can do everything with three of the CD4066 IC's and maybe add something like a binary to decimal IC to cut down on the number of lines needed to control the keypad.

I have looked at the chirp softwarre that loads the memory and setup of the radio thru the RS232 port but that has limited capabilites and I wanted to try and control the radio on the fly.

Then with the arduino board I can go back and look at packet, bluetooth, network, other interface shields.

From: Erik
Topic: 32110 Message: 32110

G'Day,

Thought I'd try and compile as best I can all the CHIRP settings available for the Baofeng UV-5R+ and what each of them do and how they affect your radio.

Some of these I will need help figuring out what they do, but here goes:

Basic Settings:

Carrier Squelch - can be set 1-9, defines how strong a signal has to be before it is picked up by the receiver.
Battery Saver - unsure of this one - seems to delay the receiver activating on reception of a signal, not sure why. Need more information.
Backlight Timeout - might have something to do with the setting of 'Standby LED Color'. Need more information.
Beep - Keypad beep, you can either enable or disable.
Timeout timer - Times out a transmission after a set length of time to prevent channel hogging. Also useful to avoid overheating the LCD display and/or final transmitter transistors.
Display Mode (A) - Used in MR mode, has the following settings:
* Channel (shows the current memory number for the frequency you have selected)
* Name (the name you set for the frequency you have selected)
* Frequency (self explanatory - shows the frequency in the memory you have selected.
Standby LED Color: can be set to either Blue, Orange or Purple or just turned off.
RX LED Color: this is a back light colour, illuminates when you are receiving messages. Can be set to Blue, Orange or Purple or turned off.
TX LED Color: same as RX LED Color except illuminates when transmitting.
Roger Beep - transmits a short 'beep' when you release the PTT button so the other channel users know you've finished transmitting. Can be enabled or disabled.

Advanced Settings:

VOX Sensitivity - used when you want to speak into the radio without pushing PTT. Can be set from 1-10. 0 turns it off.
Dual Watch: Watches two different frequencies/memories at once and listens for activity on either one.
Dual Watch Priority: Three settings, Off, A and B. if set to either A or B, that display's frequency or memory shown will be scanned for activity more frequently than the other display.
Alarm Mode: Three settings. Site, Tone, Code. Site is for alarm testing and does not transmit alarm over the air. Need more information.
Voice: The voice you hear when you operate the radio manually. Can be set to English, Chinese or turned off.
Scan Resume: Has three settings: TO, CO and SE. Need more information.
Busy Channel Lockout: Stops you transmitting on a channel that is receiving a signal. Can be set either enabled or disabled.

Automatic Key Lock: Can be set either enabled or disabled. Need more information.
Broadcast FM radio: Can enable or disable reception of the broadcast FM band.
Squelch Tail Eliminate (HT to HT): Can be enabled or disabled. Need more information.
Squelch Tail Eliminate (repeater): Can be set from 1 to 10 or turned off. Default is 5. Need more information.
STE Repeater Delay: Default is off, can be set from 100ms to 1000ms (0.1 to 1 sec). Need more information.
RESET Menu: Enables Menu 40, can be enabled or disabled.
All Menus: can be enabled or disabled. Need more information.
VFO/MR button (F-11 only): Redundant, not needed for UV-5R+.

Other Settings:

Firmware Message 1: Shows firmware version.
Firmware Message 2: Shows firmware version.
6+Power on Message 1/2: Need more information.
Power-On Message 1: Welcome Message Line 1.
Power-On Message 2: Welcome Message Line 2.
Power-On Message: Can be set to 'Full' or 'Message.' Need more information.
VHF Lower Limit (MHz): Cannot be set below 136.
VHF Upper Limit (MHz): Cannot be set above 174.
Limits the frequencies that can be manually entered and stored by user.
VHF TX Enabled: can be enabled or disabled. Possibly redundant, need more information.
UHF Lower Limit (MHz): Cannot be set below 400.
UHF Upper Limit (MHz): Cannot be set above 512.
UHF TX Enabled: can be enabled or disabled. Possibly redundant, need more information.

Work Mode Settings:

Display: Can be set to either A or B. Need more information.
VFO/MR Mode: Can be set to either Frequency or Channel. Apparently sets the radio mode on boot up.
Keypad Lock: Can be enabled or disabled. Need more information.
MR A channel: Displays the memory channel for the 'A' display upon boot up, selectable from 0-127. Any channels not programmed apparently have a default frequency. Need more information.
MR B channel: Same as MR A channel except using the 'B' display.
VFO A Frequency: Default frequency to be displayed on 'A' display.
VFO B Frequency: Same as VFO A Frequency except using the 'B' display.
VFO A Shift: Can be set to either Off, + (positive) or - (negative) offset.
VFO B Shift: Same as VFO A Shift.
VFO A Offset: If set, will offset the entered VFO freq positive or negatively with the chosen offset (range is 0.00 to 69.95).
VFO B Offset: Same as VFO A offset.
VFO A Power: Can be set High or Low. Controls which power modes are set upon switching displays with the A/B button.
VFO B Power: See VFO A Power.
VFO A Bandwidth: Can be set either Narrow or Wide for either display.
VFO B Bandwidth: Same as VFO A Bandwidth.
VFO A PTT-ID: Need more information, can be set from 1 to 15.
VFO B PTT-ID: See VFO A PTT-ID.

VFO A Tuning Step: When either the A or B display is selected, using the up/down arrow keys in VFO mode will make the frequency step up or down the kHz setting here. Can be set from 2.5kHz to 50kHz.
VFO B Tuning Step: See VFO A Tuning Step.

DTMF Settings:

Need more information on pretty much all of the following:
PTT ID Code 1-15
ANI Code
ANI ID
Alarm Code
DTMF Sidetone
DTMF Speed (on)
DTMF Speed (off)

Thanks,

Erik

I tried that.
When I set the trx to narrow some tones are better but still not a perfect dtmf encoder.
And btw when it is on narrow the squelch is always open ... ?
When I use the encoder program it seems like the 2nd tone is always louder (of the 2 tone sound).
Doe nobody else have this issue with BFB307 ?

This is the version which is showed by starting the trx with button 3. However baofeng stopped with updating this. You can see the (real ?) version by using one of the recent daily build of Chirp.
Look into Settings | Other settings and you'll see the version under the field "firmware version 1".
Mine is BFS307.

32114. RE: [baofeng_uv5r] Re: DTMF codes - erratic behavior ?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-06 14:01:48 UTC
From: Michael Black
Topic: 32038 Message: 32114

I just ran a test with my UV-5R(BFB307) and UV-5RPlus (BFB301). Recorded the audio from transmitting DTMF tones (which sounded very clear to me) using Sound Record on Windows XP 64, saved in 8Khz, 16-bit mono, PCM format. Recorded from my mobile where it's just a bit over squelch (around S7).

Used http://sourceforge.net/projects/fbdtmfdetector/files/latest/download to detect the tones.

I walked the keyboard twice from upper left by row.
So should see
ABCD123*4560789#ABCD123*4560789#

On both radios saw this instead:
ABCD12*456078ABCD12*456078

I repeated this a few times and it was consistent.

So unless the DTMF decoder is funky my units are consistently mis-sending 3, 6, 9 and #. All of which use the 1477 Hz tone
http://en.wikipedia.org/wiki/Dual-tone_multi-frequency_signaling

So then I took SigView and did an FFT analysis of the tones.

DTMF wants 1209, 1336, 1477, and 1633Hz and adds them on a different tones of 697, 770, 852, and 941Hz.
http://en.wikipedia.org/wiki/Dual-tone_multi-frequency_signaling

I see for □3□:
697.27Hz
1476.6Hz □ with a level of 3336 versus 17778 for the 697Hz or about 19%

If I then look at □2□ right before it:
695.31Hz
1335.9Hz □ level of 10002 versus 16404 for the 697Hz or about 61%

Now look at □6□:
769.53Hz
1476.6Hz level of 3329 versus 19194 for the 770Hz or about 17%

So it appears to me that when they are adding the 1477Hz tone they aren't adding enough of it and therefore many detectors may be missing all four 1477Hz characters.

Mike W9MDB

Attachments: 1 described; binary payloads are missing from this source WARC

And here's a time FFT that shows weak 1477hz and also weak 1633Hz tones.
It's consistent.

I'm thinking these tones are software generated and somebody didn't do a
very good job.

32118. Using CHIRP to Confirm Firmware Version

Good afternoon all!

Just rcvd my UV-5R+, downloaded CHIRP and cloned the rig's memory (my PC runs Win8). Using the "press 3 and power on" approach I see I have firmware BFB297. Using CHIRP, I went to "Other settings" tab but do not see "Firmware Message" lines 1 and 2. What am I doing wrong?

You need one of the daily builds - last release version didn't have it.

May as well get the latest.

Hi I just got my Baofeng UV-5R+ . I am a total noob.

I am in Canada and I did purchase my study guide for my Amateur radio license.

In the mean time is there anything I can do with the radio while not licensed ?

I guess I was hoping I could at least use it as a scanner for local police , Fire Dept in the meantime until I have my license.

Or maybe program it to work as a walkie talkie with my friends GMRS Uniden.

I did get the USB and software , but When I try to install driver it gives a error, I don't think its windows 8 compatible.

If anyone would like to give me some time to help me test this thing out , It would be much appreciated.

Thanks for your time.

Banks

Well, I can help you with the Win8 Driver. This one worked for me.

Vista <http://pic.radioshop888.com/abc/software/Vista&win7_64_Installer.exe>
&win7_64_Installer.exe

http://pic.radioshop888.com/abc/software/Vista&win7_64_Installer.exe

Once you download it, right click on it and click RUN AS ADMIN. Once
installed, reboot and give it a shot. I had to do this a couple times
before it worked properly.

Good luck!

Chad

Thanks. I was reading the tut and I have the driver. I just installed Chirp and see I have firmware version BFB-307.

It is a little progress i guess lol. Now I need to find out the next step.

Maybe I am in over my head ?

Thank you for your research. I really appreciate the effort !

It seems like the dtmf implementation is broken. The correct decoding depends a bit (on my trx) of the receiving end. On 1 repeater I can consistently open de echotest node (9999).

I wonder if the dtmf encoder works perfect on the earlier versions ? And I guess the issue is consistent on all uv5's with firmware > BFB301 ? Maybe someone can chime in with new and older versions ?
Frankly II am a bit surprised that no one else noticed this before ? I would think that dtmf is commonly used ?

I a wondering if I should return the trx (if possible) ...

And does the UV-B5/B6 have the dsame tmf problem. I don't want to start a complete discussion on
this trx btw

My apologiesI wasn't meaning to say ignore,but I understand that the legal side says its not FCC certified for a MURS and I know about the license I was just needing the direct information concering if it would work,and since I have gotten that answer that it will work can someone explain how to program it using CHIRP or the STOCK programming software,The reason i asked was cause I picked this radio up at a yardsale the other day for 10 dollars.

Either read in your radio or select a previously saved image file. The blank file created from File -> New can not be uploaded to _any_ radio and therefor is not really useful.

I believe that John means for you to go to the RadioReference website to look up the frequencies in your area. That service does not require membership. You will have to manually type the data into your CHIRP spreadsheet.

I am confused. When I 1st used chirp it made a clone. I saved it as a image called baofeng clone. When I open chirp and reopen that image it shows me 2 . the original one and the current one,. The only difference between the 2 is that I programmed one channel manually.

So is that considered backed up ?

Chirp has multiple tabs .every time you open a file or clone a radio you get a new tab.
Don☐t ever modify your ☐baofeng clone☐ file. You can save your other tab under a new file name (your choice of course) and then just keep updating that.
I save my changes with dates so I can go backwards in case the radio ever gets hosed.
So ☐Baofeng UV5R 20130896☐ for today for example.

32152. Scanning Resume menu option-> Fixed time

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-06 21:20:14 UTC
From: toshutrinity
Topic: 32152 Message: 32152

I read Jim's detailed menu reference and Menu item 18 tells us that by selecting TO we have a timed option where after a "fixed period" of time scanning is resumed....

What I would like to know is how can you adjust the time period that the radio sits on an active frequency before it continues scanning?? I did not see that in the menu reference (does not mean its not there) ;-)

32153. Best Antenna for Baofeng UV-5R

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

Well, today my oldest UV-5R decided to quit transmitting. Determined it IS putting out a signal, just no audio on the signal. Quickly found it was a bad mic jack.

Tried plugging/unplugging, all that jazz. No luck. I had a set of jacks and decided to change them. Once I got into this saw that I would have nothing but trouble trying to unsolder the jack, even with my 2.5 magnifier, I just chucked it. I now have a spare battery, antenna, knob, keypad, and a few small parts.

Oh well, I can get another for cheap.

I'll recommend this thread:

http://groups.yahoo.com/group/baofeng_uv5r/message/31713

Once you think you know what you want after reading that thread ask again and see what feedback you get.

You're in for a lot of reading and learning if you plan on making this a hobby..

Hey... Just new to this group and to the baofeng uv-5r plus. I've searched around to find some info but having trouble finding the info. Sorry if they've been asked before.

1) Is there a way to assign actual alpha names to channels(I'm guessing only thru software?)
2) I've put some freq into channels and now can only hear one channel at a time. (I thought it was able to listen to the 2 channels that were showing on the display)
3) Can't find a download for the software(Windows 7)

Thanks in advance.

Hi , I am a newbie too. I used this http://trac.chirp.danplanet.com/chirp_daily/LATEST/ and just INSTALLED THE .exe
Not sure about the Alpha names.

As for dual channel I think that allows it to scan back and forth on both channels not listen to both at the same time.

Hope it helps lol I don't know much , But trying to give back what i can.

Banks

Yes. 6-characters using the OEM software. 7-characters using the CHIRP
software.

> 2) I've put some freq into channels and now can only hear one channel at a

Select 1 channel in the top display and the other in the bottom display.
Set menu 7 (TDR) to ON. TDR scans between the top and bottom display.

> 3) Can't find a download for the software(Windows 7)
>
How can you join this group and not find the software? Links to both the
OEM and CHIRP are on the website that you were requested to go visit.

You can't adjust it. "fixed" was intended to imply "not changeable".

Master Banks,

I totally agree with John. You will find that hams with "K" calls are smarter than most. Go to the Miklor site and read it all. Download the pertinent parts, print them and step thru them. I had never used a Baofeng or CHIRP and went thru with no trouble at all. Just calmly go thru the steps as if it's a game.

I do not encourage ignoring the rules, but if you behave, you should not have issues.

Good luck and have fun,

Bill - K4IZE

Bill,

I guess that means the "W" calls are even smarter (hi, hi)? I had to throw that in now that my wife got her vanity W7WBE call, but I'm sure she would agree.

Hey guys. I’ve been reading the list for a couple days and it’s a great place to be. I am blind and really want to get one of these radios. With all the models I’ve heard about just variations on the uv5r theme, which one should I really purchase? And, where to buy it? There are no ham shops near me and HRO doesn’t seem to carry the Baofeng brand. I really like the idea that this radio voices at least most of the menus or that’s at least what I understand. I use special software to read the computer so e-mails are fine. I have my Technician’s license and want a radio I can actually use to get on the air without sighted help. And, you guys say this radio is cheap. That’s good cause that means I can get a radio a whole lot quicker I think.
I did find a file giving nonvisual tips on operating the radio so think that will be helpful. Is anybody programming and using this radio by the audio?

Greg,

I have been amazed by the number of blind and vision impaired hams that I have met in this group. They are all a great bunch of guys. I have personally helped a few and, believe it or not, a few have helped me.

As long as it starts with UV-5R, they are all the same (except for UV-5RAX and UV-5RCX, they are 144/220 radios). The extra letters and symbols after the UV-5R only indicate the many different case styles and probably won't matter to you. The classic UV-5R (without any extra letters or symbols) is easier to find extended batteries for. Most any other accessory will work on all models.

One thing you might consider is the UV-82. It has can have a local courtesy beep set to the upper [A] display or lower [B] display when the received signal goes away. That way if you have dual monitoring ON, you will know if the station you heard was on the [A] or [B] display. The radio also has 2 [PTT] buttons, 1 for [A] and 1 for [B] so you can immediately reply without having to select the correct display first.

Actually, on Vista, after step 6 you should be done. Skip the rest. Just go into Device Manager to see what port has been assigned and verify that the installed driver is v3.2.0.0.

Hi Greg:

Next to getting married, getting my BAOFENG was one of the best things I have done. Well, that's a little extreme. I am blind and program the radio almost exclusively using its audio function. Some say manual programming is better for those of us who are blind because, unless things have changed, programming software is not blind friendly. I have had a lot of help from members of this group and can do very well that way now.

Feel free to contact me if I can help. My e-mail address is kc3fi@.... I was born in 4 land but left there in 1970.

I recently for a UV-5RE, as per the instructions I charged it before using it. The light went green. I then used it until the battery ran down.

Now it doesn't seem to charge, after a day the charger light stays red, and the radio will run for a few seconds when removed from the cradle then power off.

Suggestions?

Lonney

Hi Lonney,

First, make sure the radio is turned off when it is charging.

Second, the charging cradle has a reputation of have cold solder joints and no solder joints inside. If you are handy with a soldering iron, you can easily remove the bottom take care of these issues. Mind was soldered OK but there were a few solder blobs inside that I was able to remove before they could shake loose and cause trouble. So it is worth opening up and doing an inspection even if it is working OK.

Phil,

You are probably doing nothing wrong. I've looked all over for a .tpe file to test with and can't find one. Would you email me yours so I can experiment with it?

Thanks,
Jim KC9HI

32194. help! shop in new york city that sells UHF-VHF

sorry for the inconvenience but my friend is going to New York City and I asked him to buy a Radio UHF \ VHF (Baofeng UV-5r) for me. Here in Brazil one of these radio costs more than 600 bucks. But he has no idea where to buy, wanted to know if there is a store that has these products in the city center. thank you guys

Let us not ignore the "legal" part of anything.

No. This radio will not work.

In searching the topics and reading this reply, it would seem that IF the radio was set up with the "normal" full band limits, then you could be able to scan the entire band when you are in frequency mode??

obviously this would take forever...

it seems as though when you do this, the radio starts the scan at whatever frequency it was last at, in freq mode.??
I guess you could manually enter a frequency in freg mode to start from, but NOT save that freq in memory??

Toshu

Try putting in your local NOAA station since it broadcasts 24 hours a day.

You should be able to just enter the frequency directly from frequency mode.

http://www.nws.noaa.gov/nwr/nwrbro.htm

If you can't hear that you might have a bad radio.

Also try the ear piece that comes with it. You may have a bad mic jack
which is keeping the speaker disconnected.

Either way I'd send it back.

You understand that it's not legal, but since you got the answer that it would technically work then you want to go ahead and do it anyways.

...

I'm not surprised Walmart is like this. They are notorious for paying their employees so little that most of them have to rely on government assistance to survive.

Topic: 32211 Message: 32211

Hello All,

I am a member of my County Search and Rescue Team and am using the Baofeng UV-5R Plus+ for operations and training. I am attempting to set the radio up for use on the local SAR, National SAR, County LE and Mountain LE/BLM. I have setup my radio and am recieveing a signal, however, I'm not sure if I setup my CTCSS correctly...

For many of the LE channels, it states a CTCSS Tone of 156.7 or 136.5 etc. My question is; should my "Tone" CTCSS be the same for the "ToneSql" in Chirp? Or should I use the referred CTCSS from the channel and leave the Tonesql at 88.5? I want to use the specific CTCSS so I can send and recieve ONLY the signals that are used by the local SAR/LE. Also, without knowing the DTCS code and DTCS Rx Codes, should I leave them at 23?

Thanks much for the help!
M

Hi All,

Reviving the discussion from January, has anyone found an inexpensive transceiver that uses the RDA1847 or similar with a digital baseband interface?

I want to take the I/Q out to my computer sound card -- think it would be great to have a transceiver with panadapter display, SSB (all mode) demodulation capabilities, etc.

> >
> > I am not sure if the RDA1846 could do 9k6 natively (please correct me if I am wrong). However, in the programming manual, it says it can 'TX and RX code', but I dont know what this means, and the pin that is used for that is not connected to the MCU. Maybe by 'code' they mean the radio can modulate the freq based on the status of the gpio. This could then give us the ability to do FSK and with the help of an MCU do 9k6.

I don't know if a part 15 justification might be valid or not on these frequencies, given the apparent lower power (ERP) of your transmissions. If you could do this within the amateur radio bands and have a license, the proposition would appear more likely to be technically legal. Try seeing if you can find a busy public service frequency and see if you can receive it also using your Audrino setup. My guess is that it should be perfectly legal to transmit on your FRS radio and to receive on the test setup. If you have a high enough gain on the antenna, you might be able to scan using the audrino setup. But what a fantastic job you're doing, and good results so fast. Both the MCU and the RDA chip have less than 56 pins. Which pin 56 are you referring to? When you say "register value, register value" does that mean "address, configuration data, next address, next configuration data?

> > > I have finally managed to interface with the RDA1846 over i2c (I changed the protocol from spi to i2c, since its simpler to interface with the arduino). For a while I was able to interface with the RDA1846, but I was only receiving static when the sq was open. It took me a while, but then I remembered that they are switching the RX signal on an off to save on battery, and since I have uv5r mcu disabled, it did not turn on the RX circuit. I tied pin PC1 (RX POW) to 3.3v and everything seemed to work. I tested the radio by tuning it to a FRS channel 7 and using one of my FRS radio, I sent DTMF codes. I know this is not completely legit, but I think I am not technically doing anything wrong (the FRS radio I bought at radio shack does not need a licence, and I am only using the UV5r as a receiver. Please let me know if I am correct about this).
> > >
> > >
> > >
> > > I also wrote an arduino code to configure registers via the serial terminal. It looks like the UV5R mcu monitors the sq pin and when it is on, it sends a RX on to the RDA1846. So for now I was basically just turning on the RX and turning it off. Here is a video of the radio receiving the DTMF tones on the FRS radio service. http://youtu.be/S71XOMIpkog
> > >
> > >
> > >
> > > However, I noticed that the radio can only receive when the FRS radio is fairly close. Additionally, I am not receiving anything on the VHF band (like the NOAA weather). I think this might be because I dont have a good ground on the antenna, or it might be because i am not controlling the UHF/VHF pin 56. Any ideas?

Attachments: 1 described; binary payloads are missing from this source WARC

As a follow-up I just received a UV-F9 and I did a DTMF test with it..again walking the keyboard from upper left to lower right.

It worked just fine with my test setup. Also I monitored our police freq and the audio is MUCH better than the UV-5R..was getting a lot of hiss (no matter what antenna I used) but is now almost crystal clear with the F9 stock antenna.

I went back and repeated the test with the UV-5R and it failed the same way with the same recording levels the F9 passed with.

Is it possible there's some frequency filtering going on with the UV-5R for the audio out where the DTMF tones are injected? Much the same as the mods to fix the audio input filtering?

Here's what the UV-F9 looks like.much more consistent amplitudes on the upper tones and the dtmf detection got it 100% correct.

Not yet. Been waiting for the same thing. The RDA1847 looks promising. I tried getting samples from them but never received a response.

Date: 2013-08-07 22:14:15 UTC
From: cnabski
Topic: 32038 Message: 32216

And which firmware version does this UV-F9 have ?
Btw my chirp software (daily build of 2/8/2013) shows BFS307 and not BFB307. Is that just an error in Chirp or another version ?

Other issues I have:
- Set to narrow FM Squelch open all the time. Receiver overload ?
- 2m frequencies squelch open on some repeater frequencies when mobile (with no apparant signal.

70cm reception and transmit seems to good.
I could live the quirks of the software programming and other stuff but less happy now.

Jim,

Thank you for the reply. That’s what its all about, helping each other however we can. I’ll take a second look at that uv-82. That could be interesting but not sure I can think in two realms at once. I do like the apparent simplicity of the uv5r of just putting it on one band and leaving it there. More to ponder.

Greg

Hey guys. I’ve been reading the list for a couple days and it’s a great place to be. I am blind and really want to get one of these radios. With all the models I’ve heard about just variations on the uv5r theme, which one should I really purchase? And, where to buy it? There are no ham shops near me and HRO doesn’t seem to carry the Baofeng brand. I really like the idea that this radio voices at least most of the menus or that’s at least what I understand. I use special software to read the computer so e-mails are fine. I have my Technician’s license and want a radio I can actually use to get on the air without sighted help. And, you guys say this radio is cheap. That’s good cause that means I can get a radio a whole lot quicker I think.
I did find a file giving nonvisual tips on operating the radio so think that will be helpful. Is anybody programming and using this radio by the audio?
Greg KI4LDU

--

Greg,

I have been amazed by the number of blind and vision impaired hams that I have met in this group. They are all a great bunch of guys. I have personally helped a few and, believe it or not, a few have helped me.

As long as it starts with UV-5R, they are all the same (except for UV-5RAX and UV-5RCX, they are 144/220 radios). The extra letters and symbols after the UV-5R only indicate the many different case styles and probably won't matter to you. The classic UV-5R (without any extra letters or symbols) is easier to find extended batteries for. Most any other accessory will work on all models.

One thing you might consider is the UV-82. It has can have a local courtesy beep set to the upper [A] display or lower [B] display when the received signal goes away. That way if you have dual monitoring ON, you will know if the station you heard was on the [A] or [B] display. The radio also has 2 [PTT] buttons, 1 for [A] and 1 for [B] so you can immediately reply without having to select the correct display first.

Bob,

Thanks for that encouragement. From what I've read, to program manually is simply knowing what is needed and taking the time to patiently just plug it in step by step. The commands are simple, just gotta follow the format. I'll keep you in mind and never hesitate to just write and say howdy. dgcnc@...

Hi Greg:

Next to getting married, getting my BAOFENG was one of the best things I have done. Well, that's a little extreme. I am blind and program the radio almost exclusively using its audio function. Some say manual programming is better for those of us who are blind because, unless things have changed, programming software is not blind friendly. I have had a lot of help from members of this group and can do very well that way now.

Feel free to contact me if I can help. My e-mail address is kc3fi@.... I was born in 4 land but left there in 1970.

Hey guys. I've been reading the list for a couple days and it's a great place to be. I am blind and really want to get one of these radios. With all the models I've heard about just variations on the uv5r theme, which one should I really purchase? And, where to buy it? There are no ham shops near me and HRO doesn't seem to carry the Baofeng brand. I really like the idea that this radio voices at least most of the menus or that's at least what I understand. I use special software to read the computer so e-mails are fine. I have my Technician's license and want a radio I can actually use to get on the air without sighted help. And, you guys say this radio is cheap. That's good cause that means I can get a radio a whole lot quicker I think.
I did find a file giving nonvisual tips on operating the radio so think that will be helpful. Is anybody programming and using this radio by the audio?

Brian,

Another good source of information on program accessibility for the blind is www.freedomscientific.com They are the maker of the primary screen reader software we use with the computer and they have information on their website and are also very receptive to specific questions too on the topic. Jaws (their screen reader) is a very powerful program and it is easy to make software that is friendly with it. The main thing is use text and graphics or instead of them and not just little icons and cute stuff. And, label everything we need to be using. So many things nowadays are actually using images with today's technology and that doesn't work. That is why I really like what I'm reading about the Baofeng radios. They are straightforward and with the voice, quite useful I'm told.

My UV-5R+ came with charge in the battery and I used it until the battery ran down... after about a minute of charging it in the desk charger it shows full battery on the display when i remove it and turn it on. I'm sure I've done something wrong.
First time UV-5R series radio owner btw, so I'm liable to make mistakes.

Any help is much appreciated.

First off, make sure you (and your SAR group) have (written) permission to have those various frequencies programmed into your radios.

If you set the frequencies to transmit the proper tone, and receive with no tone, you should be okay. If you do set a receive tone, then it will normally be the same as the transmit tone (but there are certainly cases where it could be different). The license holder and radio shop for them should be able to provide all those details.

Hi M,

The 88.5 for CTCSS and the 23 for DTCS are just default and are ignored unless the "Tone Mode" setting (and sometimes "Cross Mode" setting) indicates they are being used. See the CHIRP guide on the Miklor.com website.

If that doesn't make sense, or makes sense but still gives you trouble, then click View in the menu bar and then enable "Hide Unused Fields".

To TX a 156.7 Hz CTCSS tone and have carrier squelch set:
Tone Mode = Tone
Tone = 156.7
ToneSql = 88.5 (the default because it is unused)

To TX a 156.7 Hz CTCSS tone and require a 156.7 Hz to open squelch set:
Tone Mode = TSQL
Tone = 88.5 (the default because it is unused)
ToneSql = 156.7 Hz

If you need both 156.7 and 136.5 tones, then you will have to program 2 channels, 1 for each tone.

Date: 2013-08-08 05:22:07 UTC
From: Erik
Topic: 32229 Message: 32229

G'Day again

Just got one question - got my Baofeng a couple days ago and used it for several days as a scanner (transmit inhibited) on a few popular local frequencies. It came with some charge in the battery, and ran for a few days then I left it on overnight and it had gone flat and could not be used until i plugged it into the charger for a few hours. Everytime I've used the radio it's been showing the full battery icon on the display as far as I know. Does this icon change with the amount of charge in the battery or would I need to periodically shut off the radio, remove battery and check battery voltage with a multimeter?

Thanks,

Erik

32230. Baofeng Program "NEWOLD"

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-08 07:18:32 UTC
From: burgoynebc
Topic: 32230 Message: 32230

I have repeatedly downloaded the programming software from the Baofeng web site entitled "NEWOLD" and find that it is defective.
This download will extract with WinZip but not 7Zip. When extracted and run on Win7 it causes the PC to crash with the screen locked up such that the baofeng fist page image continously flashes. It is virtually impossble to "end process" in task mnanager. Win7 however will eventually halt the program by itself. This renders this, the only download on the Baofeng site for UV-5R recent models, useless.
I have scanned the program and my PC and it does not appear to be a virus.

Seems Baofeng make fairly decent radios but not software. I'd use CHIRP. It's free and the drivers are freely available for the programming cable on the internet, along with guidelines for how to use it and what everything does on your radio. There's menu guides, even an annotated manual (HIGHLY recommended) all available on the internet. If you have any questions, feel free to post here.

Erik.

I use the NEWOLD software from the Baofeng website. It works fine. It can also be downloaded from the Miklor.com website. I'm sure that many have successfully used this copy. But I assure you that this copy came from the Baofeng website.

The flashing that you are experiencing is software trying to automatically detect the correct COM port to use. You either don't have your programming cable plugged in, you don't have the correct driver installed or you COM port number is higher than 16. This is explained on the Miklor.com website page for the factory software.

From: Michael Black
Topic: 32038 Message: 32237

Firmware BFB307 (Message 2) shows as BFB297 when turned on (Message 1).

My UV-5RPlus is BFB301

I don't think this is a firmware problem though..the DTMF tones are
generated by the radio chip.

I don't think it's even possible in this circuit to mess with the audio
other than through hardware.

Subject: [baofeng_uv5r] Re: DTMF codes - erratic behavior ?

And which firmware version does this UV-F9 have ?
Btw my chirp software (daily build of 2/8/2013) shows BFS307 and not BFB307.
Is that just an error in Chirp or another version ?

Other issues I have:
- Set to narrow FM Squelch open all the time. Receiver overload ?
- 2m frequencies squelch open on some repeater frequencies when mobile (with
no apparant signal.

70cm reception and transmit seems to good.
I could live the quirks of the software programming and other stuff but less
happy now.

I checked for this Jim - the Comm port was set at 4 and cable was OK. CHIRP booted immediately in comparison.
I had been used the "NEWOLD" successfully several times as I updated the data on the radio prior to this problem. Something changes to cause the problem. As a side note the prog also sometimes saves in such manner that Win7 can not find the last revision of the file

Thank you for your responses! I appreciate the help and your clear insturctions.

...and yes, we are authorized to use the freq. from the local SO/SAR. We are authorized to Tx, but really use the freq. to listen for news, updates, situations/intel. It may be rare we use the comms to Tx, but need to have the ability to do so.

I tested my radio last evening with another pre-program SO/SAR radio and my Rx and Tx codes seemed to work (I could hear my tapping on the know-to-work radio).

However, I may need to go back through my frequencies and updates some of the Tone Modes to TSQL.

Follow up questions: Is there a way to tell if I am actually "tripping" the repeater/connecting with one?

Thanks!

You have to delete the channel (Menu 28) and re-enter it all again.

Hi,

I wondering, will it be possible to change the settings of an already programmed memory channel without programming cable. If yes, please let me know how to do it?

You can update the TX frequency, menu 12 (T-DCS) and menu 13 (T-CTCS) at any time using the keypad. It is a little awkward to do because you have to do it from the upper [A] VFO and all 3 settings always get updated you even if you only need to update one of the 3 settings, you have to set all 3 or you could change a setting that you didn't want to. Once you've keyed in the settings, you write it to the target channel using menu 27 (MEM-CH).

If you need to change any other setting, the channel must be erased and recreated. Otherwise, software is needed.

Windows 7 tries to protect the "Program Files" folders by not letting you save files in them. When you do they look like they were saved there but in reality they are put in a VirtualStore folder of the same name. I don't like the OS putting files somewhere else behind my back, so I have my OEM software's shortcut setup to save my UV-5R .dat files in the UV-5R folder located in my Documents folder to keep Windows 7 from pulling these shenanigans.

The best way is to talk to someone else on the repeater. They can give you a signal report.

But if there is nobody else on the repeater, then you have to utilize the fact that most repeaters have a 'tail' of a few seconds after the station it is repeating, stops transmitting. So you would...

1 Press your [PTT] button
2 Identify yourself (ker-chunking is frowned upon)
3 Release the [PTT] button
4 Watch/listen for the repeater to stop transmitting

If you don't see the signal from the repeater after you unkey, you didn't 'trip' the repeater. This could be due to you being out of range, you are transmitting the wrong CTCSS tone or DCS code, or there is no repeater.

Jim, Sounds to me like it's the program not win 7.

I had windows 7 installed and when it came time to save the .img files, it
came up with the save document window and i selected the documents folder.

The problem you described is more like another program or even a virus has
infected your comp. Remember, not all viruses and malware programs are
picked up, not even by Malwarebytes

Another way that works on some repeaters is to key up for a second and the repeater will identify itself. Make sure the freq is clear 1st.

At least that works with some around me.

That is what is referred to as KER-CHUNKING, and it is frowned upon by most repeater operators and hams.

No, it's the file virtualization "feature" of User Account Control under
Windows 7

http://answers.microsoft.com/en-us/windows/forum/windows_7-security/how-to-disable-virtual
store-in-windows-7/55dce284-0dcd-46af-892e-d2b9cf5bcff6
http://support.microsoft.com/kb/927387
http://en.wikipedia.org/wiki/User_Account_Control

UAC attempts to alleviate this using *File and Registry Virtualization*,
which redirects writes (and subsequent reads) to a per-user location within
the user's profile. For example, if an application attempts to write to
"C:\program files\appname\settings.ini" and the user doesn't have
permissions to write to that directory, the write will get redirected to
"C:\Users\username\AppData\Local\VirtualStore\Program
Files\appname\settings.ini".

Hi Group,

I'm Dan Riley, N2EAR. Originally from Long Island, New York, I now live in South Florida. I joined the group last week and posted a thing about my difficulties with programming the radio. Unfortunately, I had the wrong e-mail setting and did not get any answers to my problem.

Basically, what the problem is that I can't program the unit. It will take only one setting and then when I want to program another channel, it won't take it. I've had the radio for about 9 months now and am still struggling with it. I have had several other guys try to program it with no luck. I don't know what else to do with it.

I am a disabled ham with cerebral palsy. I am a senior citizen with arthritic hands. I can't figure it out. The instruction booklet that came with it is useless in trying to follow the programming instructions.

Any suggestions???

Dan

You mean you got a 2-prong to 2-prong cable? Or a 2-prong to USB cable?

There is no mode to clone radio-to-radio. It's done via software on your computer.

You probably want Chirp (as most people use).

Get the latest daily build as it has some capability the release version doesn't.

If you are programming with Chirp, you can set the offset mode to "Split" and then enter the transmit and receive frequencies directly without having to calculate the offset.
You might want to program several memories with different receive frequencies to compensate for Doppler. This makes it easier to step through these frequencies as the satellite passes by.
For example, I use 436.805, 436.800, 436.795, etc.

I am attempting to setup Baofeng UV-5RA to transmit on the following repeater.

http://www.repeaterbook.com/repeaters/details.php?state_id=06&ID=8400

I am using the Baofeng software with programming cable.

The following options are set
RxFrequency 441.67500
TxFrequency 446.67500
CTSCC/DTS Dec 100
CTSCC/DTS Enc 100
TxPower High
W/N W
PTT-ID/Busy Lock are off
SigCode is 1

I have reset the phone and reloaded.

Any ideas on what I am missing? I can transmit on other repeaters with no issue.

Any ideas appreciated.

Hi Ted,

You probably need to set CTCSS/DCS Enc to OFF. Most repeaters just require
you to transmit a tone to unlock the squelch of the repeater. The repeater
usually doesn't transmit the tone back to unlock your squelch. If it
doesn't and you have a receive tone set, then you won't hear anything.

Ted (and Jim) -

I think Jim meant to say to set the CTCSS/DCS Dec to OFF. The Enc tone is likely needed to access the repeater, but the Dec tone is not required for receiving.

My computer is infected all right, by Microsoft. VirtualStore is a feature of Windows 7. Just google "Windows 7 VirtualStore".

The following is what Microsoft's MSDN.com website has to say about it.

Virtual Store

In Windows 7, many folders are made secured, which makes it impossible for an application/malware to make changes to the files in the folders. e.g. the folder C:\Program Files is secured. An application with administrator rights can only modify the files. Many older applications continuously try to store/modify files in this folder. To solve this issue, Windows 7 uses virtualization of files i.e. files will be stored in the Virtual Store. The applications are not aware of this virtualization, and thinks the files are stored on the same location. Virtualization is done separately for every user . Files are stored in C:\Users\<loginname>\AppData\Local\VirtualStore location. Program Files is one of the folders in the Virtual Store, which contains the user specific settings for the applications. All users must change the settings of the virtualized applications separately. This is an advantage as well because the changes won't affect the other users. In case user wants to disable virtualization they can do it by providing Full Control to the specific folder or by running the application with admin privileges.

Steve,

YES!! Thanks for pointing out my error. I reformatted what I hat typed to make it clearer and accidentally replaced Dec with Enc.

Set "CTCSS/DCS Dec" to OFF and set "CTCSS/DCS Enc" to 100.0

In CHIRP it would be set "Tone Mode" to Tone and "Tone" to 100.0

Ted,

Your settings should be good. What does the RepeaterBook listing that you provided mean by "Use: CLOSED"? Could that be the issue?

As others have pointed out, you need (here shown explicitly):

11 R-CTCS set to OFF
13 T-CTCS set to 100.0

FWIW, I have never found *any* good reason (hamming since the 1960s) for a ham HT being set to require a CTCSS PL tone (or DCS code) to open receiver squelch. The only possible exception is if there's a problem with regional repeater frequency coordination, in which a user finds himself regularly in the fringe coverage of two repeaters on the same frequency. But for HT receiver CTCSS to provide a solution, the desired repeater must transmit a CTCSS PL tone on its output for which the HT receiver can be programmed.

It's best to leave 10 R-DCS and 11 R-CTCS set to OFF for ham repeaters. (That's especially true with the very buggy CTCSS implementation of the UV-5R series.)

Ted -

What is the likelihood that this particular repeater is beyond the range of your 4 watt UV5R? I am also situated fairly close to a mountaintop machine but I am unable to access it with an HT... too much stuff in the way!

I think I may be tripping the repeaters then. When I keyed up and spoke, on the other (correctly programed radio), there was a brief lag time after I released the PTT that the Rx radio held. I think I must be hitting the repeater than.

For frequencies that do not have a listed recieve tone, I'm going to go back through Chirp and turn them to off=88.5.

Thanks all for your help!

Thanks for responses.

To the question on the repeater showing 'closed', I was told by the 'owner' of the repeater it was open and they do not block traffic.

Earlier in the week, I did transmit one evening, but that was it.

On the range issue. Maybe that is it? If all settings are good, maybe I will have days it works or not?

I get great reception, if that was the case then I will be impacted by RF conditions? This is where I am showing my newbie, so there would be no relation between getting a clear or strong receive signal and transmitting?

Regards,
Ted

The stock antenna isn☐t exactly known for being the best.

How far away from the repeater are you and what☐s the terrain like between
you?

Where and how are you operating your radio? Indoors or out? How you hold
it will matter and standing outdoors facing the repeater would be best (if
you have an external mic hold the radio up high to get some extra elevation
on the antenna).

Assuming you don☐t have a setting wrong then a better antenna might help.
I've been using a Browning BR-180 with considerable success but, of course,
it ain't as portable as the radio.

You can search the mailing list for "best antenna" and there are several
threads.
There's a decided lack of objective, scientific testing though.
Only one guy has done some lab testing but I'm not convinced even his setup
was 100% fair since 1/4 antennas need a ground plane and I'm not sure he
provided one.

Hard to believe that a licensed ham radio operator doesn't understand how
to use a repeater correctly.

I☐m a firm believer that there is no such thing as a stupid question.
Slamming people is a good way to discourage new people.
You guys need to relax and realize not everybody knows everything. The technician test, for example, doesn☐t even cover CTCSS or repeater operation. Matter of fact, neither does the general exam that I☐ve seen so far (which I plan on passing tomorrow).

And seeing as how you aren☐t supposed to transmit until you have your license how do you expect people to get any experience setting their radios without a license?

Plus the rule ☐if you don☐t have something constructive to add☐ why bother with the comments?

Can☐t we encourage everybody?

Mike W9MDB

No hard feelings from this Mike...If you don't ask, you don't get <-words I lived by for quite some time. I know how to input the tones to activate the repeater, but was just seeing if there was a way to ensure they were working. I've found that often, nothing in life is as easy as simply "flipping a switch." And I'm sure that goes the same for HAM Radio and electronics.

:)

The difference in the great reception and not being able to break the squelch on the repeater could be the fact that the repeater is probably transmitting 25 or 50 watts of power, where you are transmitting at about 4 watts of power.

Subject: [baofeng_uv5r] Re: Trouble Setting Options to Transmit on Repeater

Thanks for responses.

To the question on the repeater showing 'closed', I was told by the 'owner' of the repeater it was open and they do not block traffic.

Earlier in the week, I did transmit one evening, but that was it.

On the range issue. Maybe that is it? If all settings are good, maybe I will have days it works or not?

I get great reception, if that was the case then I will be impacted by RF conditions? This is where I am showing my newbie, so there would be no relation between getting a clear or strong receive signal and transmitting?

Regards,
Ted

Am I understanding the question? You have set up a repeater frequency, ctcss tone, and whatever else this one needs and you want to know if it worked? If that’s the question, I ask the same thing. What I did was to ask someone I know who has a radio to go to the frequency and see if they heard my accessing the repeater since the one in question does make a sound. If you are not licensed yet, have your friend use your radio and access the repeater and you listen to his radio. If you have access to another radio, you can use that too. Check to see if there is a radio club or contact the owner of the repeater you want to access to ask how you might locate another local ham. That is an excellent question.

Hi folks found out the tyt cable worked without a hitch and didn't need a special key to get the radio in programming mode. I love the battery life compared to any other ht I have seen.

Not really. When I was first licensed I concentrated on HF operation, SSB phone and various digital modes for the first few years. I didn't get into VHF/UHF until just about two years ago, and I had to ask a lot of questions.

In fact, I didn't even own an HT at all until last year and I bought the UV-5R.

And for any that think the Baofeng is difficult to program, I'm here to tell you they all are. Yeasus and Icoms, for manual programming, are different, but not a bit easier. None of them are "intuitive", you have to have the manual. Well, Baofeng has a terrible manual. Don't even look at it, a waste of time and energy.

And there are hams that don't know what a grid is on a tube. Other than ham amps and boat anchors, there aren't a lot of tube in use other than guitar amps. There are many with a lot of electronics background don't know a thing about tubes. I didn't, except that my brother's and dad's guitar amps had a lot of them. But I bought an amp and I learned.

So give the guy a break. ;-)

Many times I have had to teach long time hams with great technical knowledge how to program and use a repeater . They haven't always been around and there are still old time hams that have never been on FM or repeaters .
It is possible that the repeater in question has a Ker Chunk filter on the input . Just keying the microphone even with the correct offset and tone will not key it in that case . You actually have to speak into the microphone such as giving your call while you are keying the repeater up . Some areas do it to discourage people from going around and Ker Chunking repeaters and to keep the person doing so from violating the rules .
Not seen often but we did it on one of our repeaters at one time .
So try announcing your call sign when you key up and see if the repeater works then .

>
> Am I understanding the question? You have set up a repeater frequency, ctcss tone, and whatever else this one needs and you want to know if it worked? If thatâ☐☐s the question, I ask the same thing. What I did was to ask someone I know who has a radio to go to the frequency and see if they heard my accessing the repeater since the one in question does make a sound. If you are not licensed yet, have your friend use your radio and access the repeater and you listen to his radio. If you have access to another radio, you can use that too. Check to see if there is a radio club or contact the owner of the repeater you want to access to ask how you might locate another local ham. That is an excellent question.

> No hard feelings from this Mike...If you don't ask, you don't get <-words I lived by for quite some time. I know how to input the tones to activate the repeater, but was just seeing if there was a way to ensure they were working. I've found that often, nothing in life is as easy as simply "flipping a switch." And I'm sure that goes the same for HAM Radio and electronics.

Start here:
http://www.radioreference.com/apps/db/?stid=42
and drill down to your local area, and if the signals
are within the tuning range and capabilities of your
UV-5R, you should hear something.

Many areas are P25 digital on 800 MHz these days.
Your UV-5R will not do those systems. You can cover
VHF-HI and UHF. It will not tune other ranges even
with "the hack".

To expand on what Scott suggests, be sure to get a programming cable and software (Baofeng CPS or VIP, CHIRP or RT Systems) so you can program the frequencies that you find on RadioReference.com into channels that have transmitting inhibited. Unfortunately you can't inhibit transmitting on a channel that has been programmed using the keypad.

Good luck on getting your license. There are some reference materials in the group files area "- I want to be a Ham" folder.

Looks like you've lucked out:
http://www.radioreference.com/apps/db/?ctid=2279
All your county freqs are VHF-HI and UHF.
If you find you like scanning, you will probably
want to get a real scanner. The '5R is really
poor at scanning. Old conventional scanners
are a dime a dozen these days and can be had
for cheap, even free sometimes as local systems
go digital. I had a pile of conventional units given
to me a while ago but they've all been redistributed.

I have to use $400 digital scanners here to monitor
my systems in Maryland. Glad I got me one of those
PSR-800s because MD has a Phase II system in use.

My first scanner was a 10 channel non-800 unit.
That was 2 systems ago. How times have changed....

A bit of a late reply to all this, but thought I'd share a very positive experience with the Argent Data Systems Opentracker USB and the UV-5R - basically, plug and play with that configuration.

I did get a complete kit, so all I had to do was connect the supplied GPS unit to the tracker, and the Kenwood HT cable connectors to the UV-5R, and everything worked as expected.

Range was somewhat low, but I know I need to check the radio settings as well as the antenna for this config (was using a cheap magnetic mount antenna).

This may not be the appropriate forum, but maybe someone will know.

I read that the newer Baofeng UV-B5 provides a better front end and an extra watt for only a few dollars more. Does anyone know if the UV-B5 uses the same setup menus as the UV-5R?

Thanks,

Gene

Hi Gene,

No. The UV-B5 is a different radio internally with a completely different menu system.

That will indeed disable transmit on those frequencies set to OFF. Press the PTT button and nothing happens. I do this for NOAA Weather, Railroad, and Marine frequencies that I monitor.

I have a NEW r5, and had a friend copy his programming into it for local freqs. Now I am home and trying to copy to MY computer using both the baofeng software and chipper. everytime I plug in the radio with the baofeng usb cable, and try and connect to chipr, it tells me " radio does not respond"
I have tried telling windows NOT to do automatic updates, and download the correct drivers from the net, and nothing worksany help is appreciated!.

Radio does not respond, can mean that you have not pushed the plug into the radio firmly enough. You might even have to trim the plug to make it fit in the extreme.

Also, did you read the user guide and FAQ's? They are very helpful.

You are attempting to enter a frequency outside the radio's range.

If you are talking about the 88-108 mhz FM Broadcast band in the USA, no, you cannot program these channels.

You are in the wrong band, UHF instead of VHF. The same thing will happen if you are in VHF and try to enter UHF frequencies.

Press the Band button, on the right just above the keypad. Now enter your VHF frequency.

What is being used for a UV5R with a extended battery as a carrying case ?

I have a MSC-20B that works, sort of, but the strap is a bit tight.

thanks

I think they are using the antenna mounting hardware as a heatsink for the finals. Makes sense if you think about it there isn't much outside metal to dump any heat energy and the antenna mount is pretty substantial for an inexpensive radio. If this is the case I would think that some heating would be normal.

But I have yet to hear reports of premature failure of the final amplifier transistors because of this. Has anyone experienced failure of the finals in a rig using the stock rubber duck? Also, are people not reporting failure of the rig because of the low cost of replacement?

Paul,

On the newer firmware versions, the BAND is automatically selected based on the frequency entered.

In this case the user can key in 400 because the UHF lower band edge is 400.000 MHz. But the user can't key in 100 because the VHF lower band edge is 136.000 MHz. To scan the whole VHF band, the user must key in 136 to start at the low end.

Hello,

I recently bought a 5RE+ and have CHIRP running in Linux & Win7, both 64 bit so no problem there.

I figured out how to use CHIRP to skip a channel on scan after figuring out to hold the scan button for like 3 seconds to start scanning.

I'll be getting my license at the Joplin Mo. hamfest on August 24th. I've been going to do it for years and finally going to do it.

Been listening a lot and they guys around here all have one version of this HT or another.

Is there a manual way to set a channel to be skipped?

Thanks for the good luck wishes. I knew they test in Neosho, MO, but I don't know when. I googled it and all it says is pre-register and testing a 2:00 PM (no walk-ins). It doesn't say what day and gives a number to call. Being Sunday and church I doubt it is today but I'll call in a bit and find out (after church).

It would be nice to show up at the hamfest and see a couple of old friends and already be licensed and I'm ready. I also have a very nice Kenwood TS-450SAT arriving this week, and have antennas.

I looked through the menus and couldn't find skip and thought it might me called jump and abbreviated with a J or something...about went blind.

Oh well, CHIRP works just fine. I'm impressed with the radio for the price. I bought the whole setup, microphone, programming cable and radio. I didn't buy the extended battery but plan to soon. Since I can't transmit it lasts a long time.

I'll read the previous posts for any other info I may need but couldn't find this.

Thanks again.

Well – since the SWR varies wildly depending on how the antenna is held (or not held or on your hip) won't that affect your dbI measurement?

I'm still learning about this stuff but would seem SWR changes should affect dbI changes (and they should be related I would think).

Or am I wrong about this?

You are correct Mike. I apologize for the flippant remark. The radio case, your hand, you head if you are not using a remote mic, your hip if you are... all of these things will change the antenna impedance. The measurements I took minimized those contributors, so it is likely a best case.

So if I'm reading your plot correctly you're showing about 1.3dbI at the high end and 0.82dbI or such at the low end.

Somehow the lousy ¼ wave with an undetermined counterpoise beats an isotropic (i.e. 1.0dbI)? That seems to violate what I understand about ¼ wave vs ½ wave isotropic.

Or are your units different?

And what's the red square?

Bearing in mind that the instrumentation was not calibrated to the isotropic antenna, the data is relative rather than absolute.

So if I’m reading your plot correctly you’re showing about 1.3dbI at the high end and 0.82dbI or such at the low end.

Somehow the lousy ¼ wave with an undetermined counterpoise beats an isotropic (i.e. 1.0dbI)? That seems to violate what I understand about ¼ wave vs ½ wave isotropic.

Or are your units different?

And what’s the red square?

The Smith Chart is a specialized plot of complex reflection coefficients, or in practical terms, the impedance match between source and load. The center of the circle is 50-ohms non-reactive. The further you are from the center the higher the VSWR (the magnitude of the reflection coefficient.) The outer ring is an infinite VSWR where all of the power is reflected back to the load.

As you move to the right of center the resistance increases, move left and it decreases. As you move up the load (antenna) is inductive and down it is capacitive.

The red dot is the center frequency of the sweep. The frequency is increasing to the right and decreasing to the left.

A well matched, broadband antenna would cluster all of the points around the center of the circle (marked with the number 1.)

You are correct Mike. I apologize for the flippant remark. The radio case, your hand, you head if you are not using a remote mic, your hip if you are... all of these things will change the antenna impedance. The measurements I took minimized those contributors, so it is likely a best case.

Well – since the SWR varies wildly depending on how the antenna is held (or not held or on your hip) won't that affect your dbI measurement?
I'm still learning about this stuff but would seem SWR changes should affect dbI changes (and they should be related I would think).
Or am I wrong about this?

Click on RADIO then IMPORT FROM DATA SOURCE then (pick one) (I used REPEATER BOOK) enter your location and band (2M/70cm), click OK then OK again.
Upload it to the radio and test 'em out.

I'm a noob but that's what I was told to do.

Hope it helps!

32338. Looking for broken/no audio UV-5R

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-12 03:12:58 UTC
From: Cary Dreelan
Topic: 32338 Message: 32338

Hi,

Interested in trying out the hardware modifications mentioned on this group as well as on Hackaday -> http://hackaday.com/2013/02/28/hacking-a-ham-radio/

I'd rather not risk my currently new and working UV-5RA in pulling it all apart, so was wondering if now or in the future someone has an old/broken one (any of the models) they were going to throw away. I've seen a couple of threads where people have mentioned problems with the audio plugs and other things that meant that basically the radio was of no use to them any more. These or other potential hardware problems (damaged case, keys, screen etc.) sound like a perfect candidate for what I'm looking for. I'd like to try some micro-controller projects by interfacing to the radio like was done in the aforementioned hack.

So rather than throw it away, would you mind posting it to me in Australia?

Doesn't need to have battery, aerial, knob, etc. so keep them yourself as spare parts. While I'd happily take these as well, you'd probably more likely keep them for spares, if you were going to buy another one. Ideally the main board of the unit would still need to be functional for it to support my tinkering, but everything else would of course be optional.

If you have one now or in the future and are happy to donate, will provide my postage details off list. I'll gladly provide any feedback or code etc. that would come from my tinkering.

Many thanks!

Cary.

If you are using CHIRP, use File > Export to export your channels as a CSV file. Open the CSV file in Excel, remove columns you don't want, then print.

If you don't have Excel or other spreadsheet program, you can open the CSV file in a text editor such as Windows Notepad. In Notepad, you can delete the data you don't need, then print. It's messier than using Excel, but it works fine.

My favorite is www.arrowantennas.com. Their OSJ 146/440 would ba a good choice. For coax use a low loss rg8 or rg8x foam.

I've bought a bunch of different antennas from Tim at Arrow Antennas over the years. Always inexpensive and always top quality.

Hoolllld-it gang. The radio is not alive, it knows nothing of where it can and cannot work.

If you can program the frequencies and PL tones, it will work there. The right and wrong of it are the user’s concern.

>”23W for MURS, lol”

I suspect the the 23 watts was supposed to be 2 or 3 watts. And, the correct number is two.

So, to be as legal as you might be, using that radio, I’d set it on low power.

Done,

Stan

Date: 2013-08-12 20:43:38 UTC
From: Mike
Topic: 32353 Message: 32353

Hi all, I am pulling my hair out at the moment.
You see I want to input the frequency of 145.800Mhz receive and to transmit 145.200Mhz

Ok easy enough you would have thought.....But no.

I have tried the SFT-D to - and the offset frequency TO 00.600
As I believe that is correct.

Well I goto Menu 27 to save it and so it does but when I go to Channel Mode all I get is 145.800 to receive yes ok fine but when I press the TX button it stays at 145.800 and not 145.200 as it is supposed to do,
I don't think I have done any thing wrong?

But can any one help please?

It is also the same for 145.600 doing exactly the same programming from Menu stays at 145.600 on receive and not TX 145.200 as it should do but same 145.600

TIA,

Mike.

Mike,

The problem is that what you are doing is not how the radio works. The UV5R does not use or store shifts or offsets in memory channels. It stores the RX frequency and the TX frequency.

In the A VFO you key in the RX frequency, 145.800 and write it to an empty channel. That creates a simplex channel just have you have experienced. Then you key in 145.200 and write it to the same channel as before. That updated the 145.800 TX frequency to the new 145.200 TX frequency.

Visit the Miklor.com/uv5r/ website and take a look at the programming flow chart. It will show you all of the steps.

> The replacement jacks are around $5 and the problem seems to be the larger mic jack +5 vdc Mic voltage being removed from the internal mic circuit as the contact needs to close to supply that +5vdc.
>
> What I have found, is that the jacks have an epoxy seal on the tops of them. This is generally used to stop dust and other contaminates from entering into the contacts, it also provides some type of water seal if something enters the jack with the jack plug cap is removed. This thin epoxy seal is very sticky and the contacts are directly below it. One of my radios had this problem and was fixed by removing the top seal and the glue residue. The replacement jacks do NOT have this seal.
>
> It is my speculation that the seal either drops into the contact from age or the glue finds its way into the contact head from temperature or use.
>
> Mine went bad after being left in my car for a few hours- <powered off> but was a little warm from the carâ□□s interior. So I think it is heat related which causes the glue to seep from the seal film into the jack from the heat. BTW this was my second jack failure problem with these radios as I have at least 20+ of these for my Technician class student groups.
>
> You might be able to fix yours by removing the seal and using a solvent to get rid of any residue. For those that have not disassembled their radios they might be able to spray a glue removing solvent into the jack to unstick the contact. Test any solvent first to insure it will not destroy the plastic body! Alcohol works ok.
>
> Hope that helps and if anyone else has a fix on this issue please post it to this group as this jack issue needs to be fixed by Baofeng and the exact causes known so we can implement a user fix instead of returning the radios each time this problem surfaces.
>
> KK6CRP
>

Thanks, I'll try this next time. I took the UV-5R apart and was having a tough time trying to desolder the jack, but at the same time trying to not damage the SMT components around it. After considerable eye strain, even with the 2.5 magnifiers I have for model work, I looked at my time vs. cost of a new one and chucked it into the trash can.

I have another UV-5R ordered to replace it, which should be here any day.

From: blueskykmann
Topic: 26125 Message: 32359

I have one and it reverted/changed to this 220/2 meter mode and I cannot reset it to original operation. Can I sell it for a lot and buy one that works on 2m\440 ? Firmware BFB293

It was stated that it had BFB293 firmware. To my knowledge for radios with BFB291 firmware or higher, all 144/440 radios have odd numbered firmware and all 144/220 radios have even numbered firmware. So this radio is a 144/440 radio.

sure. setting to low power completely resolves the lack of regulatory certification.

how do we logically get to "low power" makes it kinda legal?
good grief.

"sure. setting to low power completely resolves the lack of regulatory certification."

HOGWASH! Low power does not grant the UV-5R any regulatory certification except Part 90 (which it already has) and, of course, use on the amateur frequencies.

here's how it works:
wal-mart uses open, unlicensed VHF multi-use frequencies. MURS.
These designated channels allow for 2W handheld transmitter use.
No license required.
Radios used for this service must meet part 90 requirements which the baofeng does.
So, anyone can buy a uv5R, program the wallmart frequencies with whatever tone they use etc, and quite legally use them to communicate with other wallmart employees...or, for that matter, who ever feels like using that channel and tone around a wallmart store.
The specific requirements for use on these open channels is very separate from other services such as FRS/GMRS etc.

If anyone says different, provide a link to the MURS certification criteria and also how the UV5R is not MURS certified.
The whole point of MURS is to allow for an unlicensed, low power VHF set of channels to be used for exactly this sort of stuff. In a store where turn over is very high, you can't possibly expect the employer to license every radio that every employee gets and may walk away with when they leave or are fired.
Wal-mart is also very much and very largely in the public eye and if there was any legal issues with the types of radios their employees choose to use on 154.57 in the course of their work, then the federal regulators would have been all over it a long long time ago.
I suspect the fact that there has been absolutely 0 interest by the FCC in this means that they are totally comfortable with it and that anything being done is legal and within regulatory parameters.

It never fails to amuse me how many people, it seems, come to this list for no other reason than to try and debate and argue the legality or certification or whatever of the UV5R for this service or that service etc.
Trust me, when there is a legitimate legal issue, the FCC will become involved and deal with it.
Commercial or business use of this little radio is not self policed you ham guys, so stop trying to police it and let the federal policing body deal with anything that becomes a problem.
It's not joe public's job to do that.
The amateur radio service is unique in that it is mostly self policed.
I have yet to come across a message on this list where someone has been charged, or had equipment seized or anything for what some claim is illegal use of the radio on this or that band or frequency etc.
And, it's not like we're a small insignificant group here either.
I know I'm pissing up a rope by saying this because there are some here who's life's mission is to be the radio cops without actually having a federal job.

Regards
Colin

MURS is NOT part 90. it is part 95.
and here's your link (and your sign...)
http://wireless.fcc.gov/services/index.htm?job=operations_1&id=multi_use

Each Multi-Use Radio Service transmitter (a transmitter that operates or is intended to operate in the MURS) must be certificated in accordance with Part 95, Subpart J of the Commission's rules. Those radio units certificated as of November 12, 2002 need not be recertificated. No MURS unit, under any condition of modulation, shall exceed 2 Watts transmitter power output.

I downloaded the file from this Group Files > - REPEATER & FREQUENCY LISTS - CHIRP image & VIP dat file > - AUSTRALIA - Frequency Lists Aus-CHIRP_UHF_VHF.img and put it on a memory stick. I created the chirp live disk and booted into the desk top and followed the instructions on the screen. I then plugged in the memory stick. Then in chirp you open the image and make any adjustments you might want such as display names or colors. then download to radio the duplex settings are already in the image, as far as I know they are correct and working well.

May I suggest that you do yourself a favour and check the actual tx and rx frequencies you have installed to be sure you are using UHF CB frequencies and not operating out of band on any channel. That can be a risk when you simply accept someone elses file and install it on your radio.

The Baofeng UV-5RAX and UV-5RCX is a 144/220 model made specifically to our spec, we are the sole reseller and distributor of this model.

The X behind the name is for our identification purposes only.

The transceiver has had the 440 part removed and fully modded to cover 220 to 260MHz full power also the antenna is resonant on 145 and 220 MHz

Here are two links to this model

http://www.radio-mart.net/Baofeng-UV-5RAX-144-220-Transceiver.html

and

http://www.radio-mart.net/Baofeng-UV-5RCX-Dual-Band-Transceiver.html

Several thousand of this model handheld have been sold by us and been successful.

Please do not take this response as an advertisement but as intended for educational purposes only.

This is the first incorrect statement. MURS (like FRS, GMRS and CB) are "Licensed by Rule". That IS in fact a license, and you must comply with the requirements of that license. Read the rules.

> Radios used for this service must meet part 90 requirements which the baofeng does.

This is the second incorrect statement. MURS is governed by Part 95, not Part 90.

> So, anyone can buy a uv5R, program the wallmart frequencies with whatever tone they use etc, and quite legally use them to communicate with other wallmart employees...or, for that matter, who ever feels like using that channel and tone around a wallmart store.

If you want to use MURS, you can buy a Part 95 certificated MURS radio and use it as you wish, so long as doing so does not interfere with someone else who is also using the frequency. But you can't legally do this using a UV5R.

> The specific requirements for use on these open channels is very separate from other services such as FRS/GMRS etc.

Partially true, there are specific requirements for use of MURS, but they are regulated by the same Part 95 of the FCC rules as FRS/GMRS.
>
> If anyone says different, provide a link to the MURS certification criteria and also how the UV5R is not MURS certified.

Someone else did provide that link a few posts ago.

> The whole point of MURS is to allow for an unlicensed, low power VHF set of channels to be used for exactly this sort of stuff.

As long as you are using MURS certificated equipment.

> In a store where turn over is very high, you can't possibly expect the employer to license every radio that every employee gets and may walk away with when they leave or are fired.

Regardless of employee turnover, I fully expect any business/employer to follow the applicable regulations when establishing/maintaining a radio system. If they choose to use MURS that is fine, as long as they use MURS certificated equipment and continue to follow the regulations that define it's use.

> Wal-mart is also very much and very largely in the public eye and if there was any legal issues with the types of radios their employees choose to use on 154.57 in the course of their work, then the federal regulators would have been all over it a long long time ago.

Sadly this is not true. The FCC's enforcement bureau pretty much only chases problems that are creating interference problems elsewhere. However, it would not surprise me to see the FCC eventually take some enforcement actions against someone, someplace, to set an example.

> I suspect the fact that there has been absolutely 0 interest by the FCC in this means that they are totally comfortable with it and that anything being done is legal and within regulatory parameters.

No, it only means they don't have the funding or resources to pursue it. Read the regulations to determine what is legal. This is like arguing it is okay to go 50 MPH over the speed limit because there isn't a police officer watching you at the moment.

>
> It never fails to amuse me how many people, it seems, come to this list for no other reason than to try and debate and argue the legality or certification or whatever of the UV5R for this service or that service etc.

Trying to educate and share valid information is part of the purpose of public forums. If you don't care to read the right answer, then don't. I agree, it isn't my place to try and enforce anything. But there is nothing wrong with trying to educate and provide accurate information.

Sarcasm? I don't think so... Here is the correct information, straight from the FCC:

MURS radios must be manufactured to meet, and must be operated
to comply with, the technical standards found in Part 95. MURS radios
must be certificated (FCC approved) in accordance with 95.603 of
the FCC Rules. Radios that were certificated for MURS use under
the Business Radio Service rules (90.203) prior to
the date of implementation of the new MURS rules(November 12,
2002) may also be used, even if they were manufactured
or first used after that date.

Since the date of certification is recent (certainly not 2002), then the radio does not meet Part 95 certification, under which it must operate.

Duane

As I have said before, there are clearly some folks that don't believe they need to be licensed to use the UV-5R radio as "they" see fit, regardless of the FCC rules (or any other country's rules). Not all of these folks fit into the Prepper category either, but they (Preppers) do tend to believe that when the SHTF all bets are off. Of course, Preppers tend to decide what is a SHTF moment as well, but that's another matter.

I'm all for helping those new folks wanting to enter the hobby, but I do think it can be done without providing them with step by step instructions on how to ignore current rules and regulations. When a conversation starts with "I don't want to get a license, but I want help on how to ...." I think we should all tread very carefully with our advice. It's one thing to help them with antenna issues, it's another thing entirely different (I believe) in helping them program their radios with EMS, Fire, Police, Ham, MURS, FRS, or even GMRS repeaters for their "emergency" use, which seems to vary greatly from user to user.

The miklor website gives plenty of information (to anyone that's willing to actually read it) as to how to properly use the UV-5R radios, and how to modify the normal factory settings to achieve many different features. If the unlicensed hoards (or those unwilling to ever get licensed) find their answers there, so be it.

As said previously, most folks (myself included) are more than willing to help newcomers to the radio hobby (and some on this forum really deserve a prize for their patience), but for us (as a group) to provide step by step instructions on how to skirt (or completely ignore) the FCC rules with their new UV-5R is, I believe, a mistake in the long term. Certainly a percentage of them will eventually upgrade to a Technician license, but many won't. Using a UV-5R at low power doesn't change the fact that many of them are being used on frequencies they are not legally able to be used, at least within the U.S.

Allright, I guess my “tongue-in-cheek” comment wasn’t too well perceived.

Since, you cannot make it legal, but I will assume that a bunch of them will wind up being used, I made the “as legal as it MIGHT be” low power comment.

Finally, it IS up to the user. Whether he, or she, is really worried about the compliance police coming to get’cha for using a non-accepted radio. When it will in fact do the job without messing up anybody else.

I’m not in the position to make that call, I cannot be the first one to throw a stone... is there anyone out there who is?

OK?

Stan

sure. setting to low power completely resolves the lack of regulatory certification.

how do we logically get to "low power" makes it kinda legal?
good grief.

Hi!

According to the group charter at http://groups.yahoo.com/group/baofeng_uv5r/

"PLEASE also no discussion of LEGALITY of this radio for FRS, GMRS, etc operation and FCC part acceptance for part 95 etc. This radio is NOT approved for that use, but it is USA legal for commercial. amateur band and any use as a receiver. Old, very stale topic. DON'T FEED THE TROLLS who bring up these topics. Just ignore it."

All it will take is a few disgruntled employees complaining to the FCC about Walmart using and/or asking employees to use none certified radios and the fines could be large.

Is there a way to do a hard reset to make my ht go back to 440mhz instead of 220? I already did the reset on the menu. This happened when I was trying to do computer programming using factory and CHIRP.

GMRS in NOT license by rule! It requires a "real license", complete with call sign.

MURS is Part 95 for the information of that junk gyy... must be a non-licensed cb good buddy.

I still see this group is an "animal house" Once again, I shall hide, and check back in a few weeks to see if the behavior has improved. (wishful thinking I know)

This is a common problem that us usually caused by the plug not fully engaged into the socket of the radio. See the 'errors' pages on the Miklor website.

Sometimes I get in different cars and my UV5R will hang up on one of the memory channels that is programmed in it... The UV5R just hang up on that frequency and make noise.... Is it any way to lock out the offending memory channel form the radio keypad such as in the field or going down the road...???.. If this can be done what firmware radio will do this..??? My firmware is a BFB307... Thank you ahead of time for any thoughts on this... Claude

I believe I remember having to update my Microsoft Visual C++ 2008 SP1 Redistributable Package in my laptop that runs Windows XP. You might give that a try if you are sure the cable is plugged in fully (believe me, many are stunned when they finally get it to go in all the way when the thought it was already there).

The cable is firmly attached at both ends. Any advice on how to use CHIRP? Not sure what to do first. I tried "downloading from radio" and I still get the same error message. Where do I start with CHIRP? The radio is new out of the box and only has what came programmed on it. Sorry to be a pain, I'm new to this.

No. That is one of several things that you can only do with software.

If you program your radio with software, about the only thing that you can do it don't program that on as scanned channel.

In a pinch, you could erase the channel using menu 28. Key it into the VFO if you still need to have access to it.

You are not a pain. This is exactly the reason I monitor this group. To help people that need help.

I would be happy to take this direct if you want. My email is: uv5r [at] kc9hi [dot] net

Any way, same/similar error with different software is a good indicator that you have cable problems. It could be your software version though. Which version of Baofeng and CHIRP are you using?

Baofeng VIP should be v12.07.25 and CHIRP should be v0.3.1 stable or CHIRP daily-20130802.

Hi, Jay1

Sorry you are having problems with your new toy. Why not program in a couple of frequencies manually so as to experience success while problem is resolved. That way you can use it. Good luck!
Bob Martin

It makes no difference if you are programming the Baofeng or any other HT, save yourself a lot of frustration etc. Just spend a little more money
and get a programming setup from RT Systems. Even with the additional money spent, you have a great radio in the Baofeng at a very reasonable
price. RT Systems I have used many of their programmers on different radios and all of them follow the same format. Read about their Baofeng
program and you will see why you should get one.

I tried seaching previous message about this problem but did not find any possible solutions.

The radio is frozen and will not respond to any keypad input, switch presses, no static or anything else from speaker. Just "frozen solid". No known reason. Had it in the charger, pulled it out to use it, and found it in this condition. I have:

removed batttery for 24 hour, reinstalled, no change.

Connected to Chirp and BaoFeng VIP software, which have worked fine in the past, now are not able to communicate with the radio.

I've had it turned on now for over 48 hours. It appears that the display is starting to dim in the left/first number area, but still frozen.

Any suggestions.

Thanks!

I have just received my UV5r+

I do not have the USB programming cable for this model
but I do have the cable for the Wouxun KG-UV6 which
has the required Plug that appears to match the UV5r+
as well.

Should the KG-UV6 USB cable work with the UV5r+.

Sounds like your radio has given up and no longer works.
If that happened to me I'd just send it back if it was under warranty, else I'd just buy another one.

Hi,

This is a question concerning the UV3R. I know this is a list for the uv5R, but as I did not get any answer then asked the question in the list for the 3R, I'll repost it here.

I know quite some people who own a UV5R also have other models of the baofeng and ... I could also be interesting to extend this question towards the 5R. Has anybody any experience with doing this with a UV5R?

Subject: [UV-3R] using an uv3rt as radio for a echolink linknode (for local use)
Date: Thu, 08 Aug 2013 23:11:00 +0200
From: Kristoff Bonne <kristoff@...>
Reply-To: UV-3R@yahoogroups.com
To: UV-3R@yahoogroups.com

Hi,

I am concidering using my uv3r as radio for my echolink linknode (as part of my "build a raspbery-pi based echolink linknode for less then 100 euro" project).

So I have two conciderations:
- the radio should be continuesly powered. I have noticed that the radio can operate with a 5 V DC USB-power supply connected to the "charging" connector. It works both with the battery inserted (indication "4.4 V" when powering up) or with the battery removed from the radio (indicating "4.9 V" when powering up).

- At certain moments (like when the echolink node is connected to a echolink conference) there can conversation going on for quite a long time (say more then a hour); so the linkradio will be transmitting for quite a long time.

Has anybody any experience with this? Any remarks? Good idea? Bad idea?

The idea is that the linkstation is limited for local use only (just around the house), so the radio will be running at low power. In the end, the fact that this radio is provides 100 mW at low-power is -for me- a bonus.
Would it make sence to reduce the voltage of the power-supply to (say) 4 V (or even lower) to reduce transmission power -and therefor heat-?

Claude does the lockup on a frequency appear to come from vehicle electronics? In my 2011 Hyundai I occasionally get "lockup" on the installed 2m rig and this carries over to the handheld Baofeng, -- the noise goes away immediately when I switch off the ignition. Sounds like it could be "router noise", perhaps from the vehicle bluetooth.
The Hyundai dealer could not find any service bulletins on this subject.

Would be interested in hearing from someone who has solved this issue.

Thanks,

VA6TJ

Some cars have a computer that has a freq. multiple that will fall on your favorite channel. Forget asking the dealer to fix this problem as he has no idea what you are talking about. Find the computer and try to shield the box with foil grounded near the case. When all else fails, open the computer, find the crystal, and pad it with 5pf cap. That will move the freq a bit but not affect the operation of the car. Good luck.
Ron

While we're on the subject...

The frequency band of 88 MHz to 108 MHz designated for broadcast radio that is incorporated into the UV-5R is not part 15 compliant considering that you can use the same radio to transmit interference on other bands. But I sure do like the feature.

I really believe that the correct use for this and other transceivers is to comply with FCC rules when using it. And I believe that only "FRS" users would be unable to operate a station with this radio because the transmit power can not be set to a half watt. The "MURS" group would need to refrain from transmitting above 1 watt.

Hey All,

I'm just wondering, where and how you all use your Baofeng radios? These radios are very useful and easy to use once you understand the programming, frequencies and features. I've got mine programmed for Search and Rescue, but have found myself using it in the car and mancave to monitor LE/FIRE/EMS, in the mountains and to talk to my kids over thier Motorola FRS.

Where do you use yours?

How m$any different ways does one have to say this, this radio is not legal to use on anything but Part 90 Business Band (with proper FCC ID tag) and ham bands. No matter what power level you set it at, it is not legal to use on FRS, GMRS, MURS, etc...., here in the USA.

If I recall the Baofeng is NOT legal on FRS.... .

I use mine as a general purpose handheld on Ham frequencies...

Hi all

I just ordered a 5B and now wonder about buying a used computer to make programing it easier. (We only have ipads and iphones since our PC died last year, which seems to be 'almost' all we need now anyway). I have no need for a new computer but would like something with wifi, USB and CD/DVD for this and other minor chores.

What are minimum system requirements for CHIRP?

Thanks

Don

Ham radio use. Last October we used them at the finish line of a 135 mile canoe and kayak race reporting results via our repeater back to race headquarters 60 miles away. Used them a lot all day, barely used any of the 3600 mah battery. It recharged in less than an hour.

I used one during Hurricane Isaac last year, working from home as the club station via the repeater when power went out at the station, until I could get up there and start the generator (fun, fun, fun in 100 mph wind and rain).

A few weeks ago, driving a rental truck full of my mother in law's furniture back from Florida, through a mag mount on the roof of the truck, talking to hams along the way through repeaters I had programmed before the trip.

Most recently, to the other club members (all UV-5Rs) coordinating lowering one of our antennas for a little service.

The usual ham radio stuff.

But the little radio has done all I've needed it to do.

Ham radio is the best (MY Opinion) use of this radio. Could we seduce you into getting a ham radio license? You sound like the kind of person who would enjoy the hobby.

Kristoff,

I'm sure it would be possible; Ramon KP4TR has used the BF-UV5R and the BF-666S for IRLP and Echolink nodes.

Subject: [baofeng_uv5r] Using an uv3rt as radio for a echolink linknode (local use)

Hi,

This is a question concerning the UV3R. I know this is a list for the uv5R, but as I did not get any answer then asked the question in the list for the 3R, I'll repost it here.

I know quite some people who own a UV5R also have other models of the baofeng and ... I could also be interesting to extend this question towards the 5R. Has anybody any experience with doing this with a UV5R?

Subject: [UV-3R] using an uv3rt as radio for a echolink linknode (for local use)
Date: Thu, 08 Aug 2013 23:11:00 +0200
From: Kristoff Bonne <kristoff@...>
Reply-To: UV-3R@yahoogroups.com
To: UV-3R@yahoogroups.com

Hi, I am concidering using my uv3r as radio for my echolink linknode (as part of my "build a raspbery-pi based echolink linknode for less then 100 euro" project). So I have two concideration:
- the radio should be continuesly powered. I have noticed that the radio can operate with a 5 V DC USB-power supply connected to the "charging" connector. It works both with the battery inserted (indication "4.4 V" when powering up) or with the battery removed from the radio (indicating

"4.9 V" when powering up). - At certain moments (like when the echolink node is connected to a
echolink conference) there can conversation going on for quite a long
time (say more then a hour); so the linkradio will be transmitting for
quite a long time. Has anybody any experience with this? Any remarks? Good idea? Bad idea?
The idea is that the linkstation is limited for local use only (just
around the house), so the radio will be running at low power. In the
end, the fact that this radio is provides 100 mW at low-power is -for
me- a bonus.
Would it make sence to reduce the voltage of the power-supply to (say) 4
V (or even lower) to reduce transmission power -and therefor heat-? 73

Hi Earl, Mine is a 91 S10 Blazer, it is definitely comping from the on-board computer of the Blazer.... I saw one suggestion to pad the computer's crystal with a 5 pf capacitor, I may have to do that, as the channel it keeps hanging up on at times I need to use that freq.... I also think an outside roof top antenna will help the problem too.... Good luck on your Hyundai, that is going to be a tough fix imagine.... very best of 73's.. Claude WB4WHH

In my 2011 Hyundai I occasionally get "lockup" on the installed 2m rig and this carries over to the handheld Baofeng, -- the noise goes away immediately when I switch off the ignition. Sounds like it could be "router noise", perhaps from the vehicle bluetooth.

I would suggest a Pentium 4 equivalent or better running faster than 1200 MHz operating Linux or Windows XP. If it does not have PAE (Physical Address Extension) then you will have problems running recent versions of Linux. I know I could make less of a computer work, but I don't think I would want to talk someone else through it. If Windows XP is already installed use it, but Microsoft will be discontinuing support for XP next spring, so a Linux install on a low end XP capable computer has an attraction to me for the task. LibreOffice runs under Windows and Linux and can manipulate your CSV files.

Hi Don,

It is more a matter of how dumb can the computer be to run the host OS. If the OS will run, then CHIRP should be fine.

So for Windows, the computer should be capable of at least running Windows XP. If the computer doesn't qualify for running XP, it could still be capable of running Linux. If you have someone 'burn' a copy of CHIRP Live to a flash drive (USB/SD/SD micro), the the PC wouldn't even need to have a working hard drive (it would have to be capable of booting from a USB drive, though). Having CHIRP Live would be a good way of testing a PC before hauling it home.

Just wanted to see if I understand this ...
If I have two UV-5R radios I know that I can just set the freq of both radios to the same freq and I can talk back and forth all day...

So, my question is... are the transmit freq and receive freq offsets used for just repeater use ???

If I do need an offset for Radio to Radio I'm not sure I understand versus just a non-offset freq Radio to Radio....

hope this makes a little sense...

thanks

Actually the FCC charges licensed amateur operators with self-policing. It IS our responsibility to make sure the airwaves under our FCC-granted jurisdiction are legally and ethically used.

Agreed but don't you also believe that you should also help educate those on other services in the proper and legal use of their radios?

  Actually the FCC charges licensed amateur operators with self-policing. It IS our responsibility to make sure the airwaves under our FCC-granted jurisdiction are legally and ethically used.

Listen all you need to do IS WATCH tuttorials. Go to www.youtube.com and type baofeng_UV5R Tuttorial and off goes the fm radio and flashlight.The reason you got that radio was to recieve anything you like from ham radio operators to police,fire ems,frs-gmrs,murs,marine and anything else on uhf & vhf.This group offers links and help so put some brain food in your belly and READ about your RADIO

I do believe that we need to educate people where on the RF spectrum a person can transmit and with what license (and proper equipment) they need in order to do so. I believe training in this comes from those who study for their licensing exams and who ask an elmer about these issues.

Also, for the gentleman who was following up about the FCC rules regarding being able to transmit on any frequency when in an emergency. That rule is here:

"FCC Part 97.403 Safety of life and protection of property.

No provision of these rules prevents the use by an amateur station of any means of radiocommunication at its disposal to provide
essential communication needs in connection with the immediate safety of human life and immediate protection of property when
normal communication systems are not available."

That means if human life or property is at risk, you can transmit (even broadcast) on any frequency and any mode until the emergency is over. That includes people who are not properly licensed.

you'd be incorrect about MURS for 2 reasons:
mainly:
the uv5r is NOT part 95 certified

AND

MURS specifies that the radio NOT BE CAPABLE of more than 2 W (not just adjusted to less than 2W)
http://wireless.fcc.gov/services/index.htm?job=operations_1&id=multi_use
No MURS unit, under any condition of modulation, shall exceed 2 Watts transmitter power output.

Keep in mind, the rule you quote from Part 97 is applicable to Part 97 and amateur radio operators (and amateur radio frequencies). Nowhere does the FCC make a blanket statement that someone can transmit on any frequency they wish to in an emergency, and there are many documented cases where people have been fined for doing so.

Also of great importance is the sentence that says "when normal communications are not available". If you can make contact and solicit help on an amateur frequency, there is no reason to transmit on a non-amateur frequency. If you can make contact on a cell phone, or by any other means of communication, then there is no justification for operating outside your license class and privilege.

What that paragraph, taken in the overall context of Part 97, says is that a ham can operate outside of his license class - a novice or tech could use Extra class spectrum to call for help. It does not say an unlicensed person can do this - "an amateur station" is associated specifically with an amateur license.

I know many will disagree with this interpretation, but when you read the fine print and everything in context (including all of the other parts of the Communications Act), this is what it is saying.

So when I'm sitting at the desk feeding a 50kW MW rig, my engine room is on fire, my hold is rapidly filling with water, my RT has gone down, and I'm out of range of VHF and mobile phone, I can't open the mic and ask my listeners to call the coastguard?

(Even if I can say "Scheveningen").

I'll take my chances later, if I get there.

Hey All,

I'm just wondering, where and how you all use your Baofeng radios? These radios are very useful and easy to use once you understand the programming, frequencies and features. I've got mine programmed for Search and Rescue, but have found myself using it in the car and mancave to monitor LE/FIRE/EMS, in the mountains and to talk to my kids over thier Motorola FRS.

Where do you use yours?

Subject: [baofeng_uv5r] Clairification Please

Just wanted to see if I understand this ...
If I have two UV-5R radios I know that I can just set the freq of both radios to the same freq and I can talk back and forth all day...

So, my question is... are the transmit freq and receive freq offsets used for just repeater use ???

If I do need an offset for Radio to Radio I'm not sure I understand versus just a non-offset freq Radio to Radio....

hope this makes a little sense...

thanks

I agree totally, please EVERYBODY, stop feeding the trolls of the volunteer FCC agents. If you want to respond by pointing to a link somewhere, fine, but stop the citizens arrest stuff. If you hear something illegal on the ham bands work with your local ham club to find them and kindly inform the perps.

If this is a moderated group, please block this stuff, (including my post if appropriate) :)

I have read some of the posts here and I am hoping I can get answers, not criticism.

I have a Tech License and limited funds. Saw this radio on Amazon for 1/3 the cost of a "traditional" radio. I have 2 children studying for aTech License and would like something we can use in case of emergency and for fun. I can buy 3 of these for the price of one of the other kinds.

My first question is " What one should I buy, if any at all". I am confused about the different models.

My second question is "Will this radio work for emergency use in town".

Thank you,

Lori. KD0QWE

Date: 2013-08-15 14:29:59 UTC
From: Michael Black
Topic: 32483 Message: 32487

Considerations IMHO - I've got a UV-5R, UV-5RPlus, and a BF-F9.they all cost about the same

UV-5R series - lots of accessories - has low audio by design

UV-5RPlus - only difference I've seen is that the extended battery needs to be modified to fit it (grind off some plastic)

BF-F9 - performs better for me (better SNR on a known station with same antenna - full quieting on BF-F9.notable hiss on UV-5R UV-5RPlus.go figgr'.they're supposed to be the same radio) - same extended battery problem as UV-5RPlus - I haven't tested the audio on this one yet but should be the same as the 5R's.

So.if you don't need/want extended battery or aren't afraid to modify it (it' s easy to do) I'd recommend a BF-F9 - it's UV-5R compatible with Chirp.

I'd also recommend you stay away from Amazon. Many have had problems with different vendors/cables on there.

Three Old Crows has been recommended by many on here (and is who I've been using).

http://threeoldcrows.com/shop/magento/

My next purchase will be a UV-B5 or B6 - purportedly has fixed low audio problems and has a better receiver than the radios above. That'll give me another test radio to play with.

You may want to consider those (only difference is flashlight or VFO knob).

Hi Lori,
you really need to tell us more details to help you make a decision. How far away is the nearest repeater? Are you in a big city metro environment, is your main usage in a car... etc. But.....the answer is probably yes. Any of these radios are probably more than adequate for what you want to do.

The models and colors are bewildering but probably any UV5R and its successors will be ok for you. fyi, I have a UV5R that works fine. I live in an extended urban area, (Austin Texas) and there's lots of repeaters around, 146 and 432mhz.

Is there a ham club in your area? Visit with those old timers and they will likely give you some good advice.

73 have fun, remember it is a hobby.

I'll second this - When using Linux, you can probably use a 15-20
year-old computer. I would suggest a free junk computer, rather than
buying one.

I was using an Apple G4 laptop in my shack for a while (from the
mid-'90s, had to netboot some kinda PPC linux), had CHIRP and fldigi
loaded onto it. As long as there is a USB or serial port on the box, you
should be able to use CHIRP.

I just got mine yesterday and programmed 37 channels in 20 min. First one I have had waiting on my hand mic, programming cable and software, sma to pl259 3ft pig tail, sma to pl259 adaptor, extended battery, extended chargeable plug in battery, car charger adaptor for base charger and battery, and the 6 aa battery case. I am a member of ARES and RACES groups and will use it there, We also do allot of public service events, I will also use it for weather spotting when I am away from my car. And everything else ham. Sat playing, ISS, you name it.

here is the link where i bought mine
http://www.ebay.com/itm/310635260553?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1439.l2649
one thing to make sure of when you get this antenna......the mast wire is painted all the way down,sandpaper enough at the bottom where it will make good contact with the base....

32497. Re: [baofeng_uv5r] How dumb a computer can run CHIRP?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-15 16:08:32 UTC
From: Greg Ames
Topic: 32442 Message: 32497

At the risk of triggering an OS religion flame war, I'm going to buck the trend and advise AGAINST Linux, unless you are already familiar with Linux (or want to spend the time to learn), you know how to administer it, and either all you want to do is run Chirp or none of your "other minor chores" require Windows-only software (and no, I am by no means an M$ devotee).

My advice is to look for something cheap (depends on your budget, say $100?) on ebay, craigslist, etc. If it's new enough that the sellers aren't giving it away as free scrap, it should be good enough to run windows & Chirp. For example, I just found a Dell laptop on craigslist asking $99, 1.4Ghz, 1GB RAM, 40 GB HDD. Plenty to get the job done.

If it's new enough to sell for something above $0, it's likely new enough to run XP (which, face it, has been out for 12 years and has pretty basic needs by today's standards).

If you go this route, I would insist on getting the original OS disk and make sure the install key on the Windows COA sticker is legible. I'd do a clean re-install to get rid of whatever junk (viruses, etc) the prior owners had on it.

Other options - really low end new machines are available for $300-$400; moderately high-end, 2-4 year old off-lease refurbished machines can be found for less (generally with a fresh windows install and OS disks).

I have a Diamond RH-771 144/430 MHz & wide band receiving coverage antenna
its its about 14 or 16 in i have not measured it but its a great little
antenna.

I would suggest 3 of a kind, although perhaps colors for the extra few dollars so your parts interchange. These radios are so low priced that you should probably consider them disposable. If one packs it in, toss the parts in a drawer and get another one. When you get to programming it, there is a sort of standard for simplex frequencies. I recommend that all the radios in the family have the same programming so you can simply say "go to channel #" and leave others looking for where you went.

For normal day to day use you will seldom need more battery than the stock unit. Myself I am inclined to simply get a couple standard sized spare batteries. I have never needed more than one charged battery for a day's outing working event communications or simply my day to day routine. (The UV-5R is my backup and the wife's primary radio.) Of course you will get as many opinions as there are list members as to the ideal system and kit.

We do have a few hot heads on this list; I simply use a heavy hand on the delete button. If you need help building a file for your radio(s) many of us will be glad to help.

If you are leaving, don't work your radio in your car. It's not considered a "hands-free" device and that's illegal.

Yes I concur, it wasn’t made for amateur service but the new programming makes it work. it’s a decent radio once you learn how to program it.

32504. Where to buy? The Old Crows and other places

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-15 16:51:39 UTC
From: Loureiro, Antonio
Topic: 32483 Message: 32504

Hi. About the Three Old Crows, I tried to find shop/store online reviews such like bizrate and resellerratings.com but to no avail. It's also the first time I came across this store... Is it really good?
Can you guys give me some info on them?
Do they ship from China directly or the radios are already in the US, etc.

I'm a first-timer with very little knowledge about radios and Baos, just about to take my license exam , being here for a week now to study the battlefield a bit, so Amazon was my first option. I never had an issue with them, but then I never got radios from them either! The only certainty I had so far was that I was going to get one from Amazon itself, their stock, and not from any retailer....

Thanks mates.

Enviada em: quinta-feira, 15 de agosto de 2013 11:30
Para: baofeng_uv5r@yahoogroups.com
Assunto: RE: [baofeng_uv5r] What to buy?

Considerations IMHO - I've got a UV-5R, UV-5RPlus, and a BF-F9...they all cost about the same
UV-5R series - lots of accessories - has low audio by design
UV-5RPlus - only difference I've seen is that the extended battery needs to be modified to fit it (grind off some plastic)
BF-F9 - performs better for me (better SNR on a known station with same antenna - full quieting on BF-F9...notable hiss on UV-5R UV-5RPlus...go figgr'...they're supposed to be the same radio) - same extended battery problem as UV-5RPlus - I haven't tested the audio on this one yet but should be the same as the 5R's.

So...if you don't need/want extended battery or aren't afraid to modify it (it' s easy to do) I'd recommend a BF-F9 - it's UV-5R compatible with Chirp.
I'd also recommend you stay away from Amazon. Many have had problems with different vendors/cables on there.
Three Old Crows has been recommended by many on here (and is who I've been using).
http://threeoldcrows.com/shop/magento/

My next purchase will be a UV-B5 or B6 - purportedly has fixed low audio problems and has a better receiver than the radios above. That'll give me another test radio to play with.
You may want to consider those (only difference is flashlight or VFO knob).

Subject: [baofeng_uv5r] What to buy?

I have read some of the posts here and I am hoping I can get answers, not criticism.

I have a Tech License and limited funds. Saw this radio on Amazon for 1/3 the cost of a "traditional" radio. I have 2 children studying for aTech License and would like something we can use in case of emergency and for fun. I can buy 3 of these for the price of one of the other kinds.

My first question is " What one should I buy, if any at all". I am confused about the different models.

My second question is "Will this radio work for emergency use in town".

Thank you,

Lori. KD0QWE

Assunto: Re: [baofeng_uv5r] Where to buy? The Old Crows and other places

I got mine from a great seller on eBay from NJ. It got to me in 2 days from paying. It came with an extra battery and a bigger better antenna 2/70 w wide band receiving coverage. All for 52.00

Can you guys give me some info on them?
Do they ship from China directly or the radios are already in the US, etc.

I’m a first-timer with very little knowledge about radios and Baos, just about to take my license exam , being here for a week now to study the battlefield a bit, so Amazon was my first option. I never had an issue with them, but then I never got radios from them either! The only certainty I had so far was that I was going to get one from Amazon itself, their stock, and not from any retailer….

Thanks mates.

Assunto: RE: [baofeng_uv5r] What to buy?

Considerations IMHO – I’ve got a UV-5R, UV-5RPlus, and a BF-F9…they all cost about the same
UV-5R series – lots of accessories – has low audio by design
UV-5RPlus – only difference I’ve seen is that the extended battery needs to be modified to fit it (grind off some plastic)
BF-F9 – performs better for me (better SNR on a known station with same antenna – full quieting on BF-F9…notable hiss on UV-5R UV-5RPlus…go figgr’…they’re supposed to be the same radio) – same extended battery problem as UV-5RPlus – I haven’t tested the audio on this

one yet but should be the same as the 5R’s.

So…if you don’t need/want extended battery or aren’t afraid to modify it (it’ s easy to do) I’d recommend a BF-F9 – it’s UV-5R compatible with Chirp.
I’d also recommend you stay away from Amazon. Many have had problems with different vendors/cables on there.
Three Old Crows has been recommended by many on here (and is who I’ve been using).
http://threeoldcrows.com/shop/magento/

My next purchase will be a UV-B5 or B6 – purportedly has fixed low audio problems and has a better receiver than the radios above. That’ll give me another test radio to play with.
You may want to consider those (only difference is flashlight or VFO knob).

I have bought 5 ham radios and many accessories from China and Hong Kong via eBay without any issues. It normally takes a while longer to ship and forget about returning them if they turn out defective. Like I said I have not had any issues. BUT; from what I hear on-line for a slightly higher price you will get first rate service from Three Old Crows AND someone who knows and backs up his product. Three Old Crows orders from Asia and only lists what he has in stock. You will get prompt domestic shipping, putting your toy in your hands in a small fraction of the time it takes to ship from Asia.

Cut your cost to the bone, wait and absorb some risk or order from Three Old Crows and have it in hand quickly with someone that will make sure it works. It is your choice. If I had more money and less time I would shop Three Old Crows.

That was actually very helpful. Thanks.
Do they really test all radios they sell? If so, that's a great differential, worth more than a 20 bucks.....

It is a great little radio for the money. Just be aware that ANY small, handheld radio will be limited in range. I can reliably hit a VHF repeater about 15 miles away from inside the house, but it is line of sight.

I disagree with the Amazon comment. Amazon's prices are about 20% less than the recommended dealer. I bought the cheapest listing on Amazon including a programming cable and antenna. Most of the problems with the cables are NOT FOLLOWING THE DIRECTIONS regarding drivers. I also suggest you do NOT buy a replacement antenna until you study them well, and see what your needs are. Many of them are dummy loads.

Amazon also offers *packs* of multiple radios at a discount. That might help in your situation. Good luck,

Bill - K4IZE

I've probably purchased more than 25 radios (so far) from Kurt at Three Old Crows (TOC). Every single one of them had been tested, and every single one of them had the rev level of the units marked on the outside of the box.

"If" your time is worth anything to you, then TOC is a great place to shop. If you don't mind waiting a couple of weeks, and taking the chance of getting a defective radio from China (it does happen), then gamble and purchase the radio there.

Hi. About the Three Old Crows, I tried to find shop/store online reviews such like bizrate and resellerratings.com<http://resellerratings.com> but to no avail. It's also the first time I came across this store... Is it really good?
Can you guys give me some info on them?
Do they ship from China directly or the radios are already in the US, etc.

I'm a first-timer with very little knowledge about radios and Baos, just about to take my license exam , being here for a week now to study the battlefield a bit, so Amazon was my first option. I never had an issue with them, but then I never got radios from them either! The only certainty I had so far was that I was going to get one from Amazon itself, their stock, and not from any retailer....

Thanks mates.

Three Old Crows has been recommended by many on here (and is who I've been using).
http://threeoldcrows.com/shop/magento/

My next purchase will be a UV-B5 or B6 - purportedly has fixed low audio problems and has a better receiver than the radios above. That'll give me another test radio to play with.
You may want to consider those (only difference is flashlight or VFO knob).

Subject: [baofeng_uv5r] What to buy?

I have read some of the posts here and I am hoping I can get answers, not criticism.

I have a Tech License and limited funds. Saw this radio on Amazon for 1/3 the cost of a "traditional" radio. I have 2 children studying for aTech License and would like something we can use in case of emergency and for fun. I can buy 3 of these for the price of one of the other kinds.

My first question is " What one should I buy, if any at all". I am confused about the different models.

My second question is "Will this radio work for emergency use in town".

Thank you,

Lori. KD0QWE

32518. Antena for dense forest use

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-15 18:20:44 UTC
From: Loureiro, Antonio

Hi there list.

The bulk of my radio need are outdoors rather than urban chit-chat so comes the questions of getting a second, longer antenna,,,,something like the 40cm (15'') nagoya-711, which I heard it thrusts the signal a long way.
For bare mountainous terrain I suppose the ducky is fine, but what about a DENSE forest with 90ft tall trees all cluttered up together, something like Costa rican rainforest??
Would a longer antenna increase penetration into (don't think so, physically) /reach out of the forest (in this case I believe it might!) ??

cheers

And then, squeeze in a little dab of clearance lamp grease into the hole in the spring before you put it back together. It’s cheap insurance sold at truck stops and auto parts stores.

Will keep the airborne crud and mud and rust from allowing the staff and set screw to become stuck in the spring. You’ll appreciate it if you ever need to take the antenna apart or make an adjustment.

Do this all the time with the commercial mobile antennas, especially for the lo-band (30-50 MHz) guys. Makes life soooo much easier if I have to replace a broken whip (mast).

Stan

32520. Offset problem on a 2M freq

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-15 19:11:46 UTC
From: invrad
Topic: 32520 Message: 32520

Hi all,

I did a search for this particular problem and found some answers that were close, but trying the solutions didn't work. So, here goes:

I'm trying to program a + offset for a local repeater, using Channel 1 on the UV-5R. I've done this both manually and using CHIRP, and get the same results either way. Whenever I program the 00600 offset, and then hit "Menu" to save it (or, change the setting in CHIRP and then load back to the radio), it "loses" this particular offset. If I'm doing it manually, as soon as I press "Menu" it goes right back to 00000. When I upload CHIRP to the radio, it shows the correct settings, but if I check the Menu settings its back to 00000. Also, the next time I d/l the settings from the radio back to CHIRP, it's also back to 00000.

None of the other channels lose their offsets -- it's only on Channel 1. Anyone else had this problem, and is it a glitch with the radio itself?

Thanks......

Rick

Hi. About the Three Old Crows, I tried to find shop/store online reviews such like bizrate and resellerratings.com but to no avail. It’s also the first time I came across this store… Is it really good?

Can you guys give me some info on them?

Do they ship from China directly or the radios are already in the US, etc.

I’m a first-timer with very little knowledge about radios and Baos, just about to take my license exam , being here for a week now to study the battlefield a bit, so Amazon was my first option. I never had an issue with them, but then I never got radios from them either! The only certainty I had so far was that I was going to get one from Amazon itself, their stock, and not from any retailer….

Thanks mates.

Assunto: RE: [baofeng_uv5r] What to buy?

Considerations IMHO – I’ve got a UV-5R, UV-5RPlus, and a BF-F9…they all cost about the same

UV-5R series – lots of accessories – has low audio by design

UV-5RPlus – only difference I've seen is that the extended battery needs to be modified to fit it (grind off some plastic)

BF-F9 – performs better for me (better SNR on a known station with same antenna – full quieting on BF-F9…notable hiss on UV-5R UV-5RPlus…go figgr'…they're supposed to be the same radio) – same extended battery problem as UV-5RPlus – I haven't tested the audio on this one yet but should be the same as the 5R's.

So…if you don't need/want extended battery or aren't afraid to modify it (it' s easy to do) I'd recommend a BF-F9 – it's UV-5R compatible with Chirp.

I'd also recommend you stay away from Amazon. Many have had problems with different vendors/cables on there.

Three Old Crows has been recommended by many on here (and is who I've been using).

I have also had this problem when entering the sixth digit.
The radio will also say CANCEL when I press the CALL/ALARM/FM button.
I've even had that FM button say TWO.
I had the light on focused beam not flashing and when I pressed VFO/MR the light went out on a full battery charge.
The second time I did it when I pressed A/B the light went out again.

Tree cover will affect 70cm more than 2m, so optimize for that band. I seem to recall that changes in polarization can make a difference, but can't recall how. Like circular or something, and I don't even recall if that was with 2 m. Anyone know?

Antonio,

You may want to consider a backpacking Yagi. Such as the first five listings at:
<http://www.arrowantennas.com/sub/arrowiiyagi.html>

They're around $50 so the price is reasonable.

Any of these will give you much more range. Of course, you can't walk through a thick jungle while using it but they're light weight, and easy to assemble. I backpack with mine in a cardboard shipping tube but a small case for a backpacking fishing rod would work better in rain.

antonio,

dense trees has an AMAZING negative effect on the signal, especially in the uhf bands. i have had to add some big amps to get through in the wet times, when a few watts would get through in the dry. fwiw, this was in washington state, and our uhf links would CEASE in the wet until we AMPED them. and we did have pretty good sized yagis, as this was a point to point link

I live a neighborhood that has dense woods all round, I can barely hit my local 2M repeater 7 miles away with a duck antenna on my HT. I'm currently using a 2M j-pole antenna by KB9VBR in the attic and can easily hit repeaters 30+ miles away. He sells a breakaway 2M j-pole and a 70CM j-pole as well http://www.jpole-antenna.com/
You could use that and some sections of a pvc pipe for a makeshift tower. This obviously isn't a good solution if you always need to be on the move, but it might work well for a campsite.

Thank you for all your suggestions.
I live in Topeka where there are several repeaters and plan to use it at home or car.

I have had a few bad experiences trying to ask for help, always feel like the slow kid in the class, so I now avoid the clubs but do read the online posts.

Thank you again for your suggestions and will probably be ordering one soon.

You are correct about the effects being greater on the 70cm. the attenuation is huge, also scattering. Not only form the leaves and trunks but also temperature and water vapour...the penetration of vhf overcompensates the capacity of uhf to bounce around the gaps.(IMO)
Looking forward to hearing about that optimization / circular antenna etc.

Tree cover will affect 70cm more than 2m, so optimize for that band. I seem to recall that changes in polarization can make a difference, but can't recall how. Like circular or something, and I don't even recall if that was with 2 m. Anyone know?

Hi there list.

The bulk of my radio need are outdoors rather than urban chit-chat so comes the questions of getting a second, longer antenna,,,,something like the 40cm (15'') nagoya-711, which I heard it thrusts the signal a long way.
For bare mountainous terrain I suppose the ducky is fine, but what about a DENSE forest with 90ft tall trees all cluttered up together, something like Costa rican rainforest??
Would a longer antenna increase penetration into (don't think so, physically) /reach out of the forest (in this case I believe it might!) ??

All of your replies have been so helpful. I did order one from from Three Old Crows after calling them. Finances were important but I also liked the idea of someone from the good old USA that answered the phone and listened to me.

I have thought about an antenna but my dashboard does not work and I am not sure how to hook it up. I will continue to study and hope to start using my radio next week.

I am sure I will be posting more questions and look forward to all your advice

This will happen when you enter a frequency outside of the band limits. If you use the VIP or CHIRP software to set the band limits to cover only the ham bands, for example, then any frequency keyed in outside of this range will result in 'cancel'.

On older firmware this would happen when you entered a UHF frequency when BAND was set to VHF or if you entered a VHF frequency when BAND was set to UHF. This was one of Buddy's tips in his "Guide for Hand-free Operation" for vision impaired UV-5R users to determine if they had the desired band selected.

> The radio will also say CANCEL when I press the CALL/ALARM/FM button.

These are probably firmware bugs. They are not hard to find.

Lori,

The UV-5R series of radios have many options that allow you to modify the features of the radio to better fit your needs. For example, you can add the Battery Eliminator option and be able to plug the radio directly into your car's cigarette lighter. You can also add an external speaker mic so that you're not lifting the entire radio every time you want to transmit. Assuming that you add an external dual-band antenna on the outside of your vehicle (highly recommended), the speaker mike will allow the radio to sit in a stationary position and whatever adapter you are using (to attach the radio's connector to the coax cable) won't have additional strain placed on it.

Once your funds free up a little, you might want to look into a mobile VHF or dual-band mobile (VHF/UHF) unit. A used VHF radio in good condition can be had for as little as $25.00 at some hamfests, dual-band units for $50-$75. Either of those choices will greatly outperform any 4 to 5 watt HT (regardless of brand). Naturally they won't be new, but a radio a few years old in good shape that puts out 40-50 watts (vs. 4-5 watts) will greatly aid in your ability to work other hams in your area.

Speaking of local hams, most clubs bend over backwards to attract new hams, especially YL's. The KAW Valley Club in Topeka meets on the 1st Friday of each month at the Topeka Shawnee County Library. They have two club 2m repeaters. The first one is on 145.270. Your transmit frequency is .600 down, so the actual frequency entry into the UV-5R for transmit would be 144.670 with a 88.5 MHz PL tone on transmit. The second one is on 145.450 with the transmit frequency of 144.850 with a 88.5 MHz PL tone on transmit. Depending on where you are located, you should be able to work one of these machines, but at least you should be able to hear one of them.

If it's like most clubs, there will always be a certain percentage of "geeks" that want to talk about digital vs. analog, or narrow-banding, or getting help fixing something that's wrong at the repeater site, but I'm sure if you ask around there are also folks there that are just interested in radio in general, and would love to help you get started correctly in the hobby.

Good luck.

32537. Squelch CTCSS not opening on UHF 70cm Amateur repeaters.

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-15 23:55:18 UTC
From: vk3jo_john
Topic: 32537 Message: 32537

I have received my new UV5-r+ a few days ago and programmed
with VK3 Amateur repeaters 2M and 70cm.

Only problem is that some if not all UHF channels are transmitting
correctly on UHF with CTSCC and the repeater opens the green receive led lights on the
radio but there is no sound coming from the speaker.

I have tried squelch settings of 3 and 5 with no success.

Any suggestions please.

73 John VK3JO

It is possible that while the repeater requires a tone from you, it does not transmit a tone (or it may transmit a different tone). Set your receive to carrier squelch, not tone squelch, and it should work.

You've programmed a receive CTCSS (Menu 11 [R-CTCS]) tone requirement for
YOUR squelch. Most repeaters require a CTCSS tone to unlock their squelch
but most repeaters DO NOT transmit a tone back to unlock your squelch.
Depending on how you programmed your radio, you will have to disable the
receive CTCSS requirement.

Keypad: Erase and reprogram channel with "Menu 11 (R-CTCS)" = OFF and "Menu
13 (T-CTCS)" = {required CTCSS tone}

OEM software: Set "CTCSS/DCS Dec" = "OFF" and "CTCSS/DCS Enc" = {required
CTCSS tone}

CHIRP software: Set "Tone Mode" = "Tone" and "Tone" = {required CTCSS tone}

When I bought mine it also came with an antenna upgrade and i live in the mountains and can hit the one 440 repeater 20 miles away through the trees hills etc/ its a Diamond RH 771 144/70 MGz and wide band receiving coverage antenna it does a great job on it. The 3, 2 meter repeaters are over 35 to 45 miles away and I am hitting all these on 5watts power.

I guess I assumed that this radio would have an APO feature. I've read closely the manual (I think) and I find no mention of such a feature. Have I missed something?

Every other ht I own (Icom and Yaesu) has an APO feature. This rig has so many other capabilities I thought it would be able to power itself off as well.

I have also found my iphone blue tooth connection wants to connect it says Motorola H300 on there which is really strange i did not think this had a blue tooth. what have you guys found. I found this by accident I always have my blue tooth feature turned on and when I went to use my phone i could not hear anything and it said blue tooth connected Motorola H300. Any one know whats up.

You are right there is no back light button. you can hit the radio button
or the light button and it will come on.

You could always pretend the "EXIT" button is Latin (or Chinese) for
Back-Light (ha, ha).

In my state (NJ) the only thing that did was exempt us from a "scanner" law which really only applied if the ham rig could not receive outside the ham bands. That law was changed a while ago. Hands free meant hands free regardless of license until that was rewritten so ham radio was exempted in the first paragraph. I carry a copy for newbie cops.

The BAND button has that function as the only useful thing that it now does. UV-5R units that have the later firmware automatically select the band based on the frequency that has been entered...the band does not have to be selected beforehand. The BAND button afterwards became totally superfluous, except as a backlight trigger. It still swaps bands between UHF and VHF when in frequency mode, but that's pretty much valueless.

Frankly, I'd rather have the BAND button replaced with a TDR button such as found on the Wouxun units. Then I wouldn't need to go to menu 7 each time I want to enable or disable channel dual watch.

32555. Charger mod - uv5r

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-16 05:13:18 UTC
From: scorpio4892003
Topic: 32555 Message: 32555

I use my uv5r as a quick mobile rig on 2m and 440 and have no trouble hitting repeaters 20 - 30 miles away. However, I find depending on the battery is a pain. And the 12 volt adapter is about handy as a screen door on a submarine. SO, I got an idea - Put a charging base in my car! Since the charger runs on 10vdc, I decided to put a 7805 regulator with a 5.1v zener diode on the ground leg inside the charger enclosure. WORKS PERFECT - be sure to use some sort of heat sink on the 7805 - does not get hot but does get warm.

explanation: If you raise the ground on the 7805 with a 5.1 zener diode the output of the 7805 becomes 10.1 volts - perfect for the charger. I mounted everything on the board by cutting the power strip in the LED region and drilling a few holes in the board. I used a 220uf 35v electrolytic across the dc input to filter any noise that might be present. For a power cord, I used a left over 12vdc power cord (with the same plug already on it)that was intended for a 12 volt heated coffee cup. And also, since this is only a regulator circuit, the wall wort power supply works perfect as well.

TRY IT !!! YOU WILL LIKE IT !!!

If you are in an apartment or housing close together , the motorola h300 is a blue tooth ear piece and may be near to you location and use by someone else do not connect to it , it would allow someone else access to your phone. there are no spects for the UV-5ra having bluetooth capabilities.

I think the only way the UV-5R powers itself off automatically is when the battery voltage drops as well, and if you are using a 3800mAh battery like I do, that's going to be quite some time.

recommended.

The regulator IC does not have a heat sink. The higher the input voltage, the hotter IC gets. I have visible signs of melted plastic on the inside of my charging base right next to the IC.

Also the charger shuts itself down when the input voltage gets above 13.1 volts (probably a thermal shut down because I believe the IC is rated for something like an 18v input) so the charger will not operate with the engine running.

I would look for a 12/24v input to 10v 500ma output power cord. The Three Old Grows General Store has them at a reasonable price.

Nice. There was a discussion about various ways of doing this about a year
ago. It was very interesting. I bought a 7810 regulator and a buck
regulator to try some of discussed 'do it yourself' solutions. I just never
go around to doing anything with it. Thanks for posting.

32566. Smiley 270a antenna-first impressions not good..

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-16 13:55:51 UTC
From: toshutrinity
Topic: 32566 Message: 32566

Based on recommendation here concerning antennas, I ordered and got a Smiley 270a collapsible antenna with a SMA-F connector.

A pic is uploaded here>
Smiley 270a antenna on UV5R
<http://groups.yahoo.com/group/baofeng_uv5r/photos/album/1035159145/pic/\
512684943/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc>

Remember, I am a newbie, waiting for my license to be official.....
My impression so far is negative. First, the fit of the connector to the radio seems to be odd, if not wrong since there is so much space between the connector and the radio itself. It does look like the internal threads are fully seated, although the internal shape of the connector has a slight shoulder. Is proper contact being made here???? I don't know.......

I have tried testing it against the stock antenna. Was listening to a local Net on a repeater about 18 miles away. Heard it clearly on my stock antenna, but with the Smiley in Full extended. 2 sections down, I heard nothing. With it fully collapsed I got an intermittent signal...Frequency was on the 2 m band.

I will be following up with Smiley to see if the connector is perhaps incorrect......

>
> I use my uv5r as a quick mobile rig on 2m and 440 and have no trouble hitting repeaters 20 - 30 miles away. However, I find depending on the battery is a pain. And the 12 volt adapter is about handy as a screen door on a submarine. SO, I got an idea - Put a charging base in my car! Since the charger runs on 10vdc, I decided to put a 7805 regulator with a 5.1v zener diode on the ground leg inside the charger enclosure. WORKS PERFECT - be sure to use some sort of heat sink on the 7805 - does not get hot but does get warm.
>
> explanation: If you raise the ground on the 7805 with a 5.1 zener diode the output of the 7805 becomes 10.1 volts - perfect for the charger.

(trimmed)

You could also simply use a 7810, which is a 10 volt regulator, or a 7812, which is a 12 volt regulator for the charging bases that require a 12 volt wall transformer.

These devices need 1.2 volts of headroom, so the 7810 will operate from 11.2 volts on up, and the 7812 will operate from 13.2 volts on up. The maximum voltage on these divices is 35 volts, but that's not usually a problem with how these are usually used.

Fit is a common problem on many antennas on the UV5 series. I use a rubber grommet I got from Home Depot to help seal the connection and make it look right for antennas that don't seat fully.

I've bought a number of antennas and they all "work" even though they don't fit the UV5R well (every other antenna has a gap). Baofeng antennas have a relatively short connector protrusion compared to all others I have.

Reception is rarely the problem most people have - it's transmitting that's the hard part. What with repeaters at 10's of watts and a good/high antenna and the radio at ~5W and barely above ground and a combatively lousy antenna. The repeater will activate your receiver well before you can even break squelch on the repeater.

I ordered one of these too but am reserving my opinion until I can test it better. I'd like to do both near-field and far-field measurements.

I should have said where I was located. I know what a blue tooth is. And I live in a very very rural area on top of a mountain with nothing around me but us. Its only been since I got the radio the other day that my iphone is picking up the Motorola H300 signal. So I believe its from the Baofeng. That is all I can think of what it was.

Thanks

Does the bluetooth go away when you turn the radio off? Take out the battery?

Is it possible you've got a hacked radio?

Also I'd start turning off circuit breakers in the house and see when it disappears if turning off the radio doesn't silence it.

Angi,

I very much doubt that this is your UV-5RA. But this should be easy to verify. Turn off the UV-5RA. Even remove the battery from the radio for good measure and then check to see if the bluetooth signal is still being detected by your phone.

Bluetooth is a very short communications system. Usually around 30 feet but I believe that some version can go further (maybe 100 ft). Seems to me that should make it easy to foxhunt the bluetooth device. I wouldn't be surprised if you wouldn't find a Motorolla H300. Did you have a guest recently that may have left one behind by accident?

At the risk of pointing out the obvious and low tech solution. I use an AC Inverter. I understand that this is a bit of overkill, but it is also convenient for charging phones laptops and other such goodies that a road warrior might need. These things are pretty widely availble in the 20-30 dollar range.

And the 12 volt adapter is about handy as a screen door on a submarine. SO, I got an idea - Put a charging base in my car! Since the charger runs on 10vdc, I decided to put a 7805 regulator with a 5.1v zener diode on the ground leg inside the charger enclosure. WORKS PERFECT - be sure to use some sort of heat sink on the 7805 - does not get hot but does get warm.
>
> explanation: If you raise the ground on the 7805 with a 5.1 zener diode the output of the 7805 becomes 10.1 volts - perfect for the charger. I mounted everything on the board by cutting the power strip in the LED region and drilling a few holes in the board. I used a 220uf 35v electrolytic across the dc input to filter any noise that might be present. For a power cord, I used a left over 12vdc power cord (with the same plug already on it)that was intended for a 12 volt heated coffee cup. And also, since this is only a regulator circuit, the wall wort power supply works perfect as well.

Excuse me, but why not just order and use a LM7810 - 10volt regulator?

Its not the house. Cause when I was at the top of the 200 acres checking game cameras it was still on. When I turn it off the phone says it can not connect because its not turned on. Its just an odd thing really.

Nope no one here and no one around but us being in the middle of 200 acres
3 miles down the dirt road with the next near by neighbor is 4 miles away.

No I dont at this time. The nearest club I go to is 2 hrs away to the south or an hr and half to the north. And it only pops up when the radio is on. I was wondering if it was rf or something interfering with the iphone that was the same signal as a Motorola H300? Like I said its a big head scratchier for me.

I have an iPad sitting within a foot of my UV-5RA and nothing shows up, with the radio tuned to either on 146.52 or 400.000 MHz. Must be a "special radio".

During times of universal deceit, telling the truth becomes a REVOLUTIONARY ACT. ~ George Orwell

32585. RE: [baofeng_uv5r] Re: Blue Tooth UV 5RA? and wondering whats going on

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-16 17:39:02 UTC
From: Michael Black
Topic: 32546 Message: 32585

Interference at 2.4Ghz seems very unlikely from a <0.5Ghz radio.

Plus sending enough Bluetooth data to register a specific device is pretty odd. I doubt any system defaults to an HT300 based on noise. Would seem like a really bad idea that doesn't fit the Bluetooth protocol.

Is it possible that some of the game cameras have implemented Bluetooth to allow you to remotely control the camera from your smart phone? If so, that may be where you picked up that something was trying to hook up with your phone.

Here's another data point to add to the pile....

My iPhone is unable to find a Bluetooth device when my UV-5RA is right next to it.

Request: Would those of you who think they can detect a Bluetooth emission from their UV-5RAs PLEASE give more details about the mode and setups in which their radios are operating AND the firmware identifier - hold down the 3 key at power up.

My firmware ID is BFB297.

Mike,

thanks for chiming in.
Are you suggesting that the poorer RX performance is OK because I may be able to have better TX with the Smiley???

Again, I am a newbie at this and my opinion subjective. I will have my ticket next week I assume and will try a comparison doing TX.

Toshu

One of the biggest issues with third-party antennas on the Baofeng units is the fact that the SMA connectors on the top of the Baofeng radios don't seem to match up (height-wise) with everything else out there. For example, two or three different F-SMA antennas all have gaps on my UV-5R units, yet all of them fit perfectly on my several different Wouxun radios. The same is true with the newer B5/B6 series from Baofeng as well.

Neither my iPhone 5, my iPad, nor my Android tablet show any Bluetooth connections with my various Baofeng radios. As to the version of software within the radios, be aware that simply holding down the "3" button when powering up the radio no longer guarantees you'll see the actual version of software, as Baofeng (for some strange reason) has set them all to show 297 for some time. All of my 307 radios still show 297 on the display. The only way to know the true software version is now to use Chirp to read it.

Is the "fit" issue of the SMA-F connection a possible impact on the RX results I am seeing??

I have used Smiley UHF antennas with same connection on Kenwood commercial radios for many years. Every one has stood up, above the radio. Every antenna has always out performed the stock antenna.

Question, carrier, does Bluetooth use just a single frequency or do they use multiple hopped frequencies? If broadband, might not see it on the analyzer.

And, does anyone know of a way to get two Bluetooth headsets to talk to each other, no phone involved.

I'm thinking that it would be nice to talk to my helper inside the bus (with me on the roof) and not have to holler.

Stan

Subject: Re: [baofeng_uv5r] Re: Blue Tooth UV 5RA? and wondering whats going on

It would need to be oscillator (harmonics) or mixer noise, but I agree to appear as an H300 is strange.

I would think this noise if present would be so low that the Iphone wouldn't detect it unless placed right up against the cell phone.

I have an Iphone 4 and no detection of Bluetooth devices near the Uv5R. Best to get a spectrum analyzer and scan the frequency ranges of the Bluetooth spectrum and look to see what carriers pop up.

Subject: RE: [baofeng_uv5r] Re: Blue Tooth UV 5RA? and wondering whats going on

Interference at 2.4Ghz seems very unlikely from a <0.5Ghz radio.

Plus sending enough Bluetooth data to register a specific device is pretty odd. I doubt any system defaults to an HT300 based on noise. Would seem like a really bad idea that doesn't fit the Bluetooth protocol.

I was thinking it was some sort of interference coming from the radio. I am going to have to do some testing with it and see what comes up.

No I dont at this time. The nearest club I go to is 2 hrs away to the south or an hr and half to the north. And it only pops up when the radio is on. I was wondering if it was rf or something interfering with the iphone that was the same signal as a Motorola H300? Like I said its a big head scratchier for me.

I should have said where I was located. I know what a blue tooth is. And I live in a very very rural area on top of a mountain with nothing around me but us. Its only been since I got the radio the other day that my iphone is picking up the Motorola H300 signal. So I believe its from the Baofeng. That is all I can think of what it was.

Thanks

The general behavior most everybody sees is that they can receive the repeater just fine but can☐t key it at all or get low/no signal reports when they do break squelch.

If you☐re talking to a repeater your UV5R receives better than it transmits (namely because the repeater power is several times the transmit power plus a better antenna on the repeater).

So it☐s not so much whether or not you can receive a repeater that☐s pretty easy but whether or not you can key it due to the low power and poor antenna on the UV5R.

And your antenna will still fit just fine .just without it seating on the radio it puts extra sideways strain on the connector. That☐s another reason to use a grommet to minimize that.

Mike,

thanks for chiming in.
Are you suggesting that the poorer RX performance is OK because I may be able to have better TX with the Smiley???

Again, I am a newbie at this and my opinion subjective. I will have my ticket next week I assume and will try a comparison doing TX.

Possible? Yes. Likely? No

If any antenna doesn't make the correct RF connection (or if the connector itself has an issue), then the antenna won't perform as advertised. That's true of any brand of antenna.

You may have an issue with the actual SMA connector on the radio which is preventing the antenna from working properly. Tolerances on Chinese made items (that lead with low price) are rarely 100% dead on to spec from one unit to the next, so it's possible than the antenna is doing exactly what it's supposed to do and that the SMA connector on the radio is slightly different (tolerance wise) vs. the F-SMA on the antenna. You might want to try it out on a completely different radio to see if your situation varies at all.

Here in the UK, radio transcievers are excempt (no idea why -
probably so the police can still use a hand-held microphone),
provided they don't operate on mobile phone frequencies.

So using a 2m or PMR set with a PTT is fine, but adapting your
phone to use the same kit is not.

Of course, you can still be done for careless/dangerous driving,
regardless of any other factor.

NO because it was doing it before hand and my game cameras are so old they
dont have that sort of tech. I wish lol.

32602. Data operations during operation of the radio

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-16 23:14:35 UTC
From: dwilcox52
Topic: 32602 Message: 32602

Can you query data from the radio while operating it to obtain any information about the real-time operation.

Interested to see if any work can be done outside of reading and loading configuration.

I would like to remote control the radio and get levels from the unit.

Thanks

W9FKQ

I remember in the mid-60s when I had a CB license (I got out when
all the rules and enforcement went out the window in the 70s) that
you were required to pull over to talk mobile on the CB but there
was an exemption for mobile telephone users. I always assumed
that was due to the big money required to have a mobile telephone
back then which were big trunk mounted units.

That seems to be the case. As it is the stock battery lasts a long time and I noticed a voice prompt last night telling me the battery was low. Mine came with an extra battery anyway so it's not like it's an issue. Still many features for what you spend. Thanks!

32607. programming for combo repeater/simplex channel

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

Topic: 32607 Message: 32607

i'm absolutely sure that this is on the miklor site somewhere, but i'm also absolutely sure someone here has already tackled it and can answer it in 15 seconds.

i want to program a channel and be able to use it as simplex or repeater so i don't have to program one channel for each use. the tone is no problem because i can send a tone on simplex with it not affecting anything. but i need to know if the '*' key reverses the transmit/receive freqs or just temporarily cancels the offset.

when i press the '*' key with a repeater channel the display changes to the offset and when i press ptt it changes to the original (programmed, non-offset) frequency. that seems like the behavior is to reverse the freqs and not just to cancel the offset.

so, is there a way to accomplish what i want to do, which is to be able to press a key or two without having to dive into the menus to use one channel for both modes? if not, anyone have the most efficient method?

thanks,

/guy (73 de kg5vt | wqpz784)

What you are asking for is commonly referred to as "Talk Around" (you talk around, not through, the repeater). I don't believe the Baofeng has the ability to program a single talk around button, so the easiest solution is two channels, one with offset, one without.

If someone does know how to program talk around please post it.

Hi Matthew,

Well, the question was more specifically about the uv3r, because I do have bit of a question on things like the radio not overheating.

I now have been doing some tests with the uv3r for a couple of days. I do have some issues:

- sometimes (but not always) when the 5 V powersupply is connected on the radio, I have no audio out. I have this with the battery is installed or without.
The strange thing is that this behaviour of the radio is not always. Sometimes it works, sometimes it doesn't.

Currently, I'm doing it differently, charge the battery during the night and have it running on batteries when I need the ling station to receive.

- It also turns out that at the end of a transmission, there is a burst of noise send on the "receive" side of the radio to the linkstation. This caused the vox-control of the linkstation to kick in.
I could not fix this without making the vox to unsensitive.

In the end, I fixed it by a small patch in thelinkbox so that the vox audio-level to trigger the vox to be different from the audio-level to keep it going.

Bluetooth operates in the 2.4GHz range, right alongside WiFi. It also uses a "random" hopping pattern. Lookup Ubertooth if you're interested in an inexpensive Bluetooth monitor. As an aside, the Ubertooth spectrum analyzer mode is useful to see if the microwave is one... it really pollutes the 2.4GHz range!

Bluetooth requires that devices are either masters or slaves. I doubt that headset vendors would have implemented the "master" functionality, so it would be surprising if two headsets would be able to communicate directly.

Guy,

The only ways of accomplishing this that I know of would be...

- program 2 channels, one for the repeater and one for simplex. Select one
in the [A] display and the other in the [B] display and swap between them
with the [A/B] key.

- program 1 channel for the repeater and setup either or both VFOs as
simplex. Select between them by using the [VFO/MR] key.

- program the repeater in the VFO. Switch between repeater and simplex by
using menu 25 (SFT-D) to switch to OFF (simplex) or (+ or -) repeater.

- listen on the repeater channel. Before transmitting, tap the [*] key to
activate "reverse mode". Transmit. Tap the [*] key to exit "reverse mode".

Tapping the [*] key puts the radio into "reverse mode" (an "R" is displayed
in the upper status display to indicate that this mode has been activated).

When reverse mode is activated, the RX and TX frequencies of both displays are swapped (TX becomes RX and RX becomes TX). To exit "reverse mode", tap the [*], tap the [A/B] key (which will also switch the selected display) or power cycle the radio.

Just to be thorough, a UV-5R channel does not store an offset. It stores the RX frequency and TX frequency. You can update the TX frequency of a channel at any time. So it is possible to switch any channel from/to simplex/repeater/cross-band in the field without erasing it first. Since you are actually reprogramming a channel, the procedure must be done from the [A] VFO.

When you are writing to an existing channel, you are not only updating the TX frequency, you are also updating menu 12 (T-DCS) and menu 13 (T-CTCS). So in addition to keying in the new TX frequency, you have to make sure that the correct DCS code or CTCSS tone is also selected. Then write the changes to the target channel using menu 27 (MEM-CH).

I did something very similar, back in January. But instead of modifying the base charger, I purchased a TYT TH-FB base charger and car charger cable (about $21 all told, plus shipping).

The charger gives a stable cradle for the radio, when it's in the car, plus, it charges on the go. So when I'm out of the car, I have a fully charged battery. Of course, now that I have the 3800mAh, that charge lasts forever.

I used some industrial strength velcro to mount the charger on the center console, and it doesn't budge.

It's the best HT-mobile setup. No swapping out batteries for battery eliminators. Never having to worry if I remembered to bring everything, or charge the battery before I left. It's the perfect all-in-one.

>
> I use my uv5r as a quick mobile rig on 2m and 440 and have no trouble hitting repeaters 20 - 30 miles away. However, I find depending on the battery is a pain. And the 12 volt adapter is about handy as a screen door on a submarine. SO, I got an idea - Put a charging base in my car! Since the charger runs on 10vdc, I decided to put a 7805 regulator with a 5.1v zener diode on the ground leg inside the charger enclosure. WORKS PERFECT - be sure to use some sort of heat sink on the 7805 - does not get hot but does get warm.
>
> explanation: If you raise the ground on the 7805 with a 5.1 zener diode the output of the 7805 becomes 10.1 volts - perfect for the charger. I mounted everything on the board by cutting the power strip in the LED region and drilling a few holes in the board. I used a 220uf 35v electrolytic across the dc input to filter any noise that might be present. For a power cord, I used a left over 12vdc power cord (with the same plug already on it)that was intended for a 12 volt heated coffee cup. And also, since this is only a regulator circuit, the wall wort power supply works perfect as well.

Another possible solution might be a N9TAX slim jim roll-up dual-band antenna http://www.2wayelectronix.com/. It's reliable, well built, and rolls up, to fit in a backpack. It's more compact than a yagi, easier to transport, and doesn't require any assembly. Roll it out, plug it in, and you're good to go.

I use a weighted heaving line (50' of 550 paracord with a weight on one end) to get it up over branches. You could use a slingshot with monofilament fishing line and a sinker, to do the same thing.

Probably not without opening up the radio and performing some kind of surgery. But even if you could, the biggest differences you would notice would be your battery would run down faster and your display would get darker sooner.

You would make a bigger difference by standing taller and/or by using a better antenna. Both would also improve your receive and neither would affect your battery life (except if the better performance allowed you to talk more :).

Check the STEP setting in menu 1, the step setting needs to be set to
something less than the 25.0K that it is probably set to. Try 10.0 or 6.25,
or if you want the most configurable frequencies possible set it to 2.5K.

Perhaps a bit or radio stuff is in order for the guy who originally asked.

I used to see this question all the time in the CB circles, way back when. Here's the real skinny.

In order for your signal to sound twice as loud at someone's AM or Side Band receiver, you have to up your power by a factor of FOUR.

In CB terms that would mean going up from four to sixteen watts. Four times more again to sound again twice as loud... 16 x 4 = 256... gets real big real quick.

Now with FM, you're either "full quieting" - meaning that there's no background hiss on your signal, or you're not... you've got some hiss there. The extra power will not make you sound any louder, just less "hissy".

So, upping your output power by a watt or two is only worth some "bragging rights" and little else. Unless you need the extra power to properly drive the amplifier you just bought.

OK?

Stan

I've been playing with my new BeoFeng UV-5R and it works great with repeaters. Today I tried to reach a buddy of mine, radio to radio. We talked on a repeater yesterday and it worked perfectly. He lives about 3 1/2 miles away and about 400 ft higher in elevation than I am. He has about 50 watts and I could barely hear him over the static with the squelch at 0. He heard me even on low power. Is there a setting I'm missing or does the receive really suck on this thing? Or does his radio suck and he doesn't know it?

BTW, I'm using a Diamond RH 771 antenna. He could hear me with the stock antenna but it didn't pick him up at all.

Thanks guys,
Chad

From: stanwhite_snr
Topic: 32481 Message: 32627

Don't think that is quite correct.

The mobile 'phone laws have been specifically written to prohibit handed operation by a driver on the frequencies used by the mobile phone system in the UK.

This has several interesting effects:

1) Regardless of the type of equipment, if it uses mobile frequencies, it is illegal to use it (as a driver of course) unless you are "hands free".

2) You CAN use a mobile phone with your hands, if it does NOT use the mobile frequencies. Funnily enough, the police radio systems look and work like mobile phones, and they do use them when driving. (I have seen them). But they are NOT breaking the law, as they use different (police allocated) frequencies. HOW VERY CONVENIENT.

3) All mobile radio systems (Amateur, CB, etc) are all OK to use as a driver. Regardless of whether you used a handheld radio, or a hand microphone, AS LONG AS YOU DID NOT USE THE MOBILE PHONE FREQUENCIES.

What would happen if you managed to use your iphone as a bluetooth audio device, connected to an Amateur radio transceiver I don't know. Technically legal, but no doubt some ignorant copper would try to prove otherwise. Equally, what would happen if you held onto your bluetooth earpiece, and made a call via your iphone, (which was laying in the boot/trunk). Not sure if that would be illegal or not. I suspect not, because you were not holding onto a device that was transmitting on the mobile 'phone frequencies. If you want to prove it with some idiot cop, however, feel free...

Of course, as noted, you can get a ticket for a myriad of offences, so if the dozy cop can't get you one way, he'll get you another, and as of last Friday, in the UK, "careless driving" can now be a fixed penaly ticket, rather than a summons to court, where proof is a lot harder.

To drag this back on track, when safe, I can, and do, use my UV-5R handheld in the car, where it seems to work reasonably well into a local repeater. But there is nothing like "metal in the sky"...

I expect the dozy cop would view handheld use as illegal, and when connected to an external antenna, legal....They don't understand the laws they are expected to uphold. Same in the US?

Regards,

Stan.

Subject: RE: [baofeng_uv5r] manual programming question

Check the STEP setting in menu 1, the step setting needs to be set to something less than the 25.0K that it is probably set to. Try 10.0 or 6.25, or if you want the most configurable frequencies possible set it to 2.5K.

Brad,

If you are talking about the TX power level setting, sure it does. Each channel can be set independently.

I didn't make myself clear - sorry.

What I meant was Chirp doesn't seem to save the power setting in the CSV (spreadsheet) file. What I'm trying to do is quickly change a range of channels from hi to low power. Looks like it would be easily done in the csv file, but if dealing within the Chirp native display, it looks like I have to click on each channel and edit it.

Maybe there's a way to edit a range of channels but I don't see that option.

This from my club president. Her husband is also a ham:

First maritime mobil report, thought you all would be interested

The UV-5R with the 7.4V; 3600 MAh battery with the NA 701 HT antenna

Burns Point, west to Jackson Bayou, all this area on the Bay.

Perfect transmit and rx using the 147.12 repeater talking to me back in Morgan City. (Paul's note - that repeater is in the next town over.)

What is Soooooooooo nice, is that (her husband, also a ham) was fishing with -----, the person responsible for us having our club headquarters and utility director who sends the bucket trucks to help us. He was very impressed with the use of the HT hitting the antenna on the court house.

So, mission accomplished!

73

So, a very impressive report. Thought you guys would enjoy this.

Paul - AE5JU

Sure, in CHIRP, using either the CTRL or ALT key click on the Loc column th channels you want to change. Then right your mouse, choose edit an in the pop up choose what fields you want to change. Make the change and click OK. Your done.

32638. Re: [baofeng_uv5r] programming for combo repeater/simplex channel

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-17 22:50:09 UTC
From: Guy Teague
Topic: 32607 Message: 32638

while reading your post i realized that i think all i need to do is:

* program only the repeater channel

* to listen on the input to determine whether you can go simplex simply hit the '*' key

* to go simplex on that channel, simply switch to vfo mode and type in the repeater output frequency as the simplex frequency.

* if there are no conflicting menu options set that affect the vfo then this should be all that's needed. it's not a one-keystroke solution, but it would save having to program two separate channels

does this sound like a reasonable workaround?

>
> Brad,

Correct. CHIRP does not export or import the Power setting to/from a .csv file.

However, what you want to do can be easily done within the CHIRP Memories editor.

Say you want to set channels 3, 4, 5 and 7 to LOW power.

1 Left-click Loc 3 (channel 3 becomes highlighted)

2 Shift-click Loc 5 (in addition to channel 3, channels 4 and 5 are now highlighted)

3 Ctrl-click Loc 7 (in addition to channels 3, 4 and 5, channel 7 is now highlighted)

4 Right-click any of the highlighted channels (a dialog box pops up)

5 Left-click the "Edit" selection (the "Edit Multiple Memories" menu pops up)

6 Left-click the tick box to the left of the Power setting (the Power setting becomes enabled)

7 Use the mouse to change the Power setting to LOW

8 Left-click the [OK] button

Done. Upload the changes to your radio.

As you can see, this type of Multiple Memory editing is not limited to just the Power setting.

Exactly. I think that's what I was trying to say!

It would be interesting to see what would happen if a case was
taken to court where the user knew the law and knew he wasn't
breaking it, but the plebs and CPS [1] didn't.

> What would happen if you managed to use your iphone as a

As long as the phone itself wasn't transmitting. Anyone fancy a
test case?

> Equally, what
> would happen if you held onto your bluetooth earpiece, and

You might have difficulty with that one, as the bluetooth device
could be said to then be part of the telephone equipment, the
fact it's connected by RF rather than copper being irrelevant.

[1] "Pleb" being a policeman, after one of them complained loudly
(and possibly falsely) about being called one - google
"PLebgate". CPS is the Crown Prosecution Service.

Sounds right to me. I believe that the menu options to watch out for would
be

1 (STEP)
10 (R-DCS)
11 (R-CTCS)
12 (T-DCS)
13 (T-CTCS)
25 (SFT-D)
33 (BAND) {only for firmware prior to BFB291}

144.200 is the national 2m SSB calling frequency. Assuming (for a second) that your friend has a license, his beam is probably horizonally polarized, so that by itself accounts for a great deal of the loss (vs. your vertical). I'd suggest picking other "test" frequencies in the future to avoid upsetting the 2m SSB folks in your area.

This is a bad idea, partly because you could interfere with other
users of the repeater and partly because if anyone triggers the
repeater your signal will be obliterated.

If you are within simplex range, find an unsused frequency.

I bought a NA-701 BNC from Lucky Castle on amazon.
This came in an orange plastic folder, with the
2 bands listed, a square barcode label and
a Nagoya hologram sticker.

Works well. Usefulfor those looking for a BNC 701.

32657. Chirp Programming for UV5R vs. UV5R+

Hello, I program and sell the Baofeng UV5R radios. I use Chirp to do the programming and just realized that last shipment of radios I got was actually the 5R+ instead of the standard 5R. I can still download and upload to the 5R, but I keep getting an error message when I try to do the 5R+. The error message I keep getting is simply "radio did not respond". I have downloaded the latest build of Chirp to make sure that was not it. Anyone have any ideas????

Thank you in advance!!

Usually this indicates that the cable was not plugged into the radio fully.
Give it an extra wiggle and a firm push.

i think you might be assuming this is a ham repeater, but this is a legitimate use on some bands which i won't get into because it triggers lawyer mode in the trolls here.

also, i just realized why this came up. i've been using my kg-uv6x instead of the uv5r until lately and the uv6x has a /rpt/ button which toggles:

+R = positive shift on receive frequency
-R = negative shift on receive frequency
R = no shift
+ = positive shift on transmit frequency
- = negative shift on transmit frequency
OFF = normal VFO mode without shift

and the button can actually be alternatively programmed to: activate a stopwatch, turn on the flashlight, enable the SOS function, turn on the FM Radio, or inactivate the button entirely. it's a candidate for the single most useful button on the radio besides the ptt.

I, too, have just acquired a UV-5R and am having the exact same problem. No luck with Baofeng software or Chirp (same error message). I have the correct Prolific drivers, but cannot connect on two different computers, one Win 7, the other XP.
How do you tell if it is a UV-5R+ model? Mine simply indicates UV-5R under the battery and front side.

Jim, thanks for your response. I have checked and double checked my program cable is property seated. I have two separate radios and I am having the same problem with both. I believe it has to do the firmware 5R+. I think I need a different build of Chirp. Does anyone have any knowledge of sources of Chirp with 5R+ compatibility? Thanks to everyone for your input.

Try a different cable. I have a cable I programmed everything I had perfectly every time until I tried to use it on a new radio. Nothing worked until I changed the cable, than a perfect connection.

From: Mike Kelly
Topic: 32657 Message: 32667

I do not know if my radio was a UV5R or plus or not but I was having the same problem loading it with Chirp wherein a message came on the screen saying the radio was not responding. After discussions with a friend of mine in the Central Valley of California he suggested I go to the Chirp site and down load a file called "Chirp Stand Alone" or "ChirpW". I down loaded the file and tried it. It worked fine. I uploaded the current radio added a few new freq's then up loaded it from the computer to the radio. All is well with my radio.

Hope this is helpful to someone.

Actually, if I'm not mistaken, many of the "distracted driving" laws have specific exemptions for ham radio written into them, much like the scanner laws that were passed in some states back when mobile ham transceivers started to support reception of frequencies outside of the ham bands.

Old thread I know. But wanted to post a follow up.

My radio says 2010 MFG on the inside circuit panel. My speaker died last week and while everything else works, I can't get it to output to the speaker anymore. Going to toss it in the trash. 3 years, for as cheap as these are, is not bad.

---As a side note to anyone wanting to take one of these apart, DONT. It's likely you wont get it back together correctly. The membrane for the keys is hard to get back to it's original posistion and the speaker wire is very fragile.

You've been warned =)

NEXT !

>
Yes. But near the end of the Cloning process you will see something similar
to...

"An error has occurred

Upload finished, but the 'Other Settings' could not be sent
because the firmware version of the image (BFB307 BFB297
) does not match that of the radio (Ver BFB231). "

This is not necessarily an "error". It is meant to be an informational
message to let you know that CHIRP stopped short of overwriting the "aux
block" with something that might be incompatible with the radio you are
uploading to.

It is only the settings on the "Other Settings" tab that don't get
transferred, and most of the time, you wouldn't want them changed anyway.

They are not "inferior copies", they are "unauthorized copies". The
Prolific company makes no money from the sales of these copies, yet these
copies need the driver written by Prolific. So Prolific changed the drivers
so that they detect the unauthorized chips and refuse to work.

Unfortunately, we as consumers, for the most part have no way of knowing if
the chip inside is genuine or not. No wanting to keep purchasing
programming cables until we got one that worked, we realized that if we
installed an older driver that was written before the unauthorized chips
were available. For Windows Vista and newer, that is v3.3.2.105. But this
version is sometimes incompatible with the Baofeng software, so it is

generally recommended that the v3.2.0.0 driver be used. I now have a few cables with genuine chips in them, but I continue to use the v3.2.0.0 driver in the Windows 7 64-bit computer, just in case I want to use a cable with one of the 'clone' chips.

For links to the v3.2.0.0 driver and instructions for how to install it, visit the Miklor.com website.

Another solution would be to use the CHIRP LiveCD. When 'burned' to a CD, DVD or USB flash drive, you boot up into Xubunto Linux with CHIRP daily-20130407. CHIRP LiveCD does not use or otherwise affect the OS installed on your computer. The open source drivers work no matter which chip you have.

When properly installed on a USB flash drive, CHIRP LiveCD can be updated to the latest daily release via the internet.

Don't toss it there are other things that can be made or done with it. My son likes to build echolink radios w a raspberry Pi and
I often try to find old baofeng's w bad speakers for his project. He has an autistic spectrum disorder mood disorder and ADHD w a learning disability but he is very smart w electronics. Consider donating it to youth for experimenting or to someone who wants to mess w it its great for kids with an inventive mind.

Total waste of time.

The difference obtained by a fraction of a dB increase in power would never be noticeable.

-----Original Message-----

From: Xaun Loc
Topic: 32619 Message: 32677

First read the information on the Miklor website.

Then set the step size to something reasonable

Then follow the instructions for entering the frequency (hint, you may need to use the up or down arrow keys to reach some frequencies, but you should be able to just type in 146.490 if you have the step size set right.

-----Original Message-----
From: hmaxim2000us

Just wondering why my 5R will not allow me to enter 146.490? The voice response repeats the numbers accurately, but the display shows "146.475". What am I doing wrong?
Thanks

Got around to sending an email to Smiley antenna with the attached foto, and a description of what I was subjectively experiencing. They replied and said that the connector is wrong and they are sending me a second one to try. Apparently they make 2 different SMA-F and sent me the wrong one???

Also, I should have my call letters later this week, so I will then start some TX testing, but, I am pretty sure that the RX is worse than the Baofeng antenna as it is now.

From: jasonandshari
Topic: 32680 Message: 32680

Call me sentimental but I'm looking to replace my lost UV5-5R which had the older 'China Girl' voice announcements. If anyone has an older HT (I don't need any extras, just the HT itself) that they would consider selling please get in touch.

Alternatively if anyone knows where I could purchase an older unit please point me in the right direction.

Many Thanks

Jason

For those of you who aren't familiar with it, DealNews is a web site
that posts well-priced items for consumers. Today they posted the UV-5r
for $32 with a little note that says "Of note, you may need a license to
operate certain frequencies." I"m going to send them email advising them
to withdraw the ad, since it's going to be illegal for just about anyone
to transmit without a license.

32682. RE: [baofeng_uv5r] TYT BCG-FY8 charger issues

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-19 19:17:46 UTC
From: Michael Black
Topic: 30947 Message: 32682
Attachments: 1 described; binary payloads are missing from this source WARC

OK.I think I'm ready to pronounce results on my battery charger testing.

The CH-5 charger overcharges my batteries to 8.44V - I don't like that and it's not easily adjustable without some idea of what the circuit components do and I can't find any docs on the chip in this thing.

The BCG-F8 as supplied didn't overcharge..but it was taking FOREVER for it to cut off charging.after 24 hours I killed it. After some testing I upped the voltage and got the charge cycle to eventually go to 0 amps. So that's the first BCG-F8 plot on the chart after I fixed that.

After some experimentation I found that increasing the voltage decreased the charge time and decreased the final charge voltage.

The beginning ramp-up you see in a couple of the lines is due to a limit on my DVM where it shows 0V when too much amperage is being consumed.

On my charger I ended up at the supplied voltage + 0.4V which leaves my battery at 8.25V when amperage finally cuts off which includes rest time and is a bit over 90% charged. I found no decrease in the battery voltage after 24 hours so it was saturated at that voltage.

http://batteryuniversity.com/learn/article/how_to_prolong_lithium_based_batteries

Of note is that the BCG-F8 green charge light comes on well before the charge is actually finished at around 8V which would be a 70% charge.

My battery now charges in a little over 3 hours instead of 5.5 hours with the CH-5.

Turning the variable resistor on the BCG-F8 counter clockwise increases the voltage. It doesn't take much to change it by 0.1V..just barely move it. But I found the voltage measurement was very inconsistent so can't use any particular measurement for a reference voltage.only relative. I can imagine a lot of variability of how these are calibrated at the factory.

So in order to test ya'lls BCG-F8 without hooking up an ammeter just let it charge overnight and measure the voltage on the battery. If < 8.2 V decrease the voltage (variable resistor clockwise) and if >8.4V increase the voltage (variable resistor counter clockwise).

Youtube video on those specific models that would seem to confirm that longer is better.which makes sense....even if they are theoretically the same.

Most everything done to any given antenna to shorten it results in loss of signal.

http://www.youtube.com/watch?v=Xuy2wbViwjo

I gotta' get an attenuator so I can do some S-level measurements on these things.

Not with test equipment, but did an informal test driving down the highway talking to a repeater owner. Another mile or two with the 771. Every few miles I would stop, swap antennas around without telling the repeater owner which antenna I was using. His reports were from "Noisy, breaking up" to "A little noise" to "Full quiet".

For range, from worst to best:

Stock Baofeng.

NA-666

Puxing J0125A (the "$3.79 antenna")

NA-701

NA-777

However, 8" for the 710 vs. 16" for the 771 is also a consideration. I like the shorter antenna for most uses.

I was surprised about the NA-666, as it doesn't really look much different from the NA-701. It is about the same length, but there was an obvious difference. It was clearly outperformed by both the J0125A and the NA-701.

The J0125A and the NA-701 were close, but the 701 a little better on range. I would call the J0125A a "best buy".

If you had to have maximum range, the NA-771 is the choice.

I like the NA-701 for my personal best all around usage.

32694. Inserting rows with the Chirp softare

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-20 01:03:48 UTC
From: James H
Topic: 32694 Message: 32694

Hi,
I am relatively new here, been mostly lurking for the last month. I purchased one of the UV-5Rs via Amazon and am taking my Technician exam this Saturday. However I do already have a GMRS LICENSE so I used the CHIRP software to load the included FRS/GMRS image on my radio. I want to insert several more rows into the image file so I can add 8 more (repeater) channels with 5 MHZ offets. I'd also like to add NOAA freqs and since I am a PA Fire Police Officer I'd like to add those frequencies too. However the image as it came with the software comes with 22 programmed channels and 3 blank rows. I have tried to copy and paste the 8 GMRS channels into the image so then I would just have to do minor edits on them. The software tells me there are not enough empty rows. I then tried to insert more rows by selecting some rows, right clicking, and selecting insert rows (above or below). Nothing happens when I do this. I did search the message archives and found 5 messages on this topic but none of them help me. My version of Chirp is 20130717.
If the radio is capable of 128 channels I'd think I could do this.
Can anyone help?
Thanks.
Jim

Just learning myself but I read at the top of your download file is a memory range. Change the number to 122 and then when you upload to your radio, you will have enough channels.

That has now exhausted my limited knowledge since I am still trying to program mine.

Best 73's

Subject: Re: [baofeng_uv5r] Antenna comparison ; 701 vs 771

I just did an unscientific test last night, on Sundays we have our club net check-in. In the past I have used a 771 or even better my RH-660S or RH-770. I have never had a problem getting into the repeater for check-in.

Well last night I had a different radio with the 701 on it, the 701 was easy to stick in my cargo shorts pocket and I was walking around all day with it. I had no time to get home from downtown to switch antennas or grab another radio, The results: I came in too weak to hit the repeater with a good signal while using the 701 while in the past had no problem hitting this repeater at the exact same place and time of the day using a 771.

Lesson: The 701 is only better because of it’s size if you are in an area where it is easy to hit the repeaters and you do not want a long antenna sticking out of your pocket. The 771 is the antenna you should use if possible.

701
2.15 db gain both bands (listed on package)

771

2.15/3db listed on the package

RH-660S

3db vhf 5.0 db at UHF

RH 770S has a 5.5 db gain listed on UHF <—this is the best so far with the downside being it is a metal telescopic antenna and not a flex one.

Those that want the best, the 770 so far is the best I have tested. I would like to get other manu’s to test in the future.

Of course this is not a scientific test using field intensity meters or any other test equipment.

You can compare them here
http://www.diamond-ant.co.jp/english/amateur/antenna/ante_3hand/ante_hand1.html

The 770 is a good choice for the uv5 crowd giving a whopping 5.5 db on UHF which is very noticeable while hitting hard spot repeaters.

Hi Jim,

I don't think you can insert more than one row at at time.

Why don't you cut and paste the channels that are in the way to a new
location and then add you new channels?

99.99% of all users would not know the difference between any firmware release. In fact, most of them couldn't find the correct release unless someone else told them how. While it's true that you can't legally use the radio for FRS, GMRS, Marine band, or MURS, that won't stop the vast majority of Amazon customers from using it anyway.

Of interest is that Diamond no longer shows the RH770 being available – and indeed I can't seem to find one anywhere except China sites.

So beware….I wouldn't buy one now as this implies any new one is likely a fake. I suppose somebody might have old inventory.

They do show these telescopic:

RH205 – 52.8" -- BNC - +9db (they rate against stock HT antenna so their ratings are pretty useless except against other Diamond antennas…which stock antenna?) – it's just a 5/8 wave

SRH779 – 17.3" -- SMA-M -- +2.15dBi(430Mhz)

Something tells me they're avoid SMA connectors on really long antennas. Too much stress on the connector I can imagine.

Any guess on the exact cost for this radio?

At $32 with free shipping, how much are they making? I do know some of these bargain radios come with the outdated Firmware versions.

The latest is (correct me if wrong) BFB307

Which cannot be viewed unless you use Chirp to see the version or a HEX editor to look at the .img file from the radio.

When I put up that post over at http://baofeng-uv-5re.blogspot.com all my information came from Amazon. I have never dealt with Radio Mart nor am I affiliated with Martyn. I have never made a purchase from Radio Mart. The last Baofeng radio I ordered was the BF-F9 from Three old crows.

32710. Black Wearing Off Keys

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-20 21:25:43 UTC
From: Jim K5JG
Topic: 26997 Message: 32710

I purchased two UV-5Rs (actually BF-F9) about three months ago and they have worked flawlessly so far.

However, a few days ago I noticed that the black finish is starting to rub off of the lower left corner of the "7" and the lower right corner of the "#" key on the radio that's been used the most. Right now, they're just tiny spots but I know they will get bigger.

I've thought about covering the spots with a very tiny dab of flat black paint and after it's dry, coating all the keys with clear nail polish to prevent this from happening again.

Any comments or suggestions?

73, Jim K5JG

32711. Second (new) UV-5R doesn't work with Chirp?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-20 22:12:36 UTC

I have my 1st UV-5R working just fine with Chirp. Worked first time and every time. I was so happy I just ordered and received another radio - same thing except camo color.

The older radio has a build #BFB293 The new one has a build #BFB297.

I tried to upload the same data (channels) to the new radio as I have in the older one. All I got was "An error has occurred - radio did not respond."

So, I downloaded the latest Chirp and installed it. Same thing happens.

I know the cable is good, yes - before you ask - it plugs fully into the new radio, I have the correct drivers for the cable (obviously because it works just fine with the older radio. What am I missing, here?

I leave on vacation in less than 24 hours and really want to get the new radio programmed before we leave.

Download whatever is on the new 5r and erase that but leave the blank sheet up. Load your set of freqs from the other HT, highlight them all and copy them, then past them into the one you downloaded from the new HT, write to the radio and that should work. Probably a issue with having different firmware.
If you can't read from the new radio, then you have problems.

Rich,
You are not getting the programming cable fully plugged into the new radio.
This is a common issue. Double check it. Give it an extra wiggle and a firm
push. You might even have to press while doing the transfer.

Jim ....

I assure you the cable is fully plugged into the new radio. That was the first thing I checked.

The only difference I notice between the two radios (except that the new one will not communicate with CHIRP) is this - when I turn on the new radio after plugging it to the cable, I get the voice prompt, "Channel mode" from the radio. This does not happen with the old radio.

Also, I have two cables. Both of them work fine with the old radio - neither work with the new one. Looking into the plug receptacle of the new radio, it looks to be identical with the old one. There is no "flash" around the plug hole which would keep the cable from fully entering the case.

I get the "radio not responding " message on all four of my uv5rs. The cable is as seated as good as it could ever get. Each radio goes to transmit mode with the cable plugged in.
What I do is connect the radio to a dummy load and do the program command twice. It always fails on the first try and works on the second.

Hello all, I am a new member with a UC-5R which I won as a door prize.

I am able to semi-program it, but it does not communicate with the programming software. The computer recognizes the programing cable and
it will start the program (read), go through the first handshaking and then it states it cannot communicate with the HT.

After reading several problems people are having I have tried several of the suggested cures without any success.

It is also noted that when attempting to transmit to a receiver the sound of a loud hum is heard, but no voice audio is transmitted.

I am curious where I might send the HT for testing and repair. As I do
not have a sales receipt I do not expect to have this under warranty.

Rich,

If the radio and cable were 'talking' together, you would receive some
other kind of error.

Does it work with the OEM software?

Jim ....

I have not tried (or even loaded) the OEM software. Should I?

It seems to me that the cable is, indeed, not making connection with the new radio. This is because of the fact that I get the same "opening" audio whether or not the cable is connected.

On the "old" radio, I get a double beep and then either, "Channel mode" or "Frequency mode" by Shanghai Rose when the radio is turned on without the cable. But, when the cable is connected, I get no audio greeting whatsoever.

I suppose I could carefully shave off the plastic lip around the pin receptadles on the new radio, but I hate to start just whittling on it.

I went ahead and manually programmed a few repeaters on the new one just to check the other functions and all is well there. I sure like the new camo case, though. :)

What is the UV5S. Is it a 5 watt radio? Is it a UV5R+? I cannot find anything about it that is consistant.

This just looks like another rebrand of the UV-5R to me. The eBay auction I was looking at said that the radio is new and has BFB293 firmware. So they might be new, but they are old stock.

Order enough radios from the custom shop at Baofeng and you can get any case style you want and whatever you want on the 'badge'.

Joe,

I would still lean toward the problem being the cable if all 4 radios do the same thing..

Have you tried trimming the end of the cable as shown.

http://www.miklor.com/uv5r/UV5R-ErrorMess.php#error1

I say this because one of my cables did the same thing, that is “Radio did Not Respond” and UV5R went into transmit.

I trimmed the end as shown in the diagram and the problem was resolved.

Yup - that's the problem. Can't read nor write. I wouldn't think the drivers for the cable chip would be a problem nor need to be changed for a different radio. Same with the com port. I have verified the com port with Windows 7 control panel and it is still the same.

Tried that - No joy. I can neither read from, nor write to the radio. I tried to explain that.

When attempting to either download or upload, I affirm the com port then comes a pop-up saying it is cloning (but no progress indicator. Within five seconds or so, I get a pop-up error message saying "An Error has occurred - Radio failed to respond". Immediately thereafter the radio repeats the double beep and says "Channel Mode" or "Frequency Mode".

Which means either the cable isn't plugged in all the way or the jack is bad. The internal speaker is disabled when the cable is properly plugged in.

I copy, OM. I think I'll take a peek at the jack if the case is easy to get apart (I haven't even looked at it - no need until now). In addition, I think the guy who put it together was eating lunch when he did the job. There's some crud on the inside of the LCD window.

BTW, here's a screen shot of the error message if it makes any difference.

I don't think it's an acidic problem since it's only the left corner of the "7" and the right corner of the "#" keys. It sounds more like a wear issue. In and out of a pocket or a case often enough to rub those spots clear.

A simple solution might be a case that covers the corners and leave it on.

Just a thought.
Chad

The ones that are not part of "most" are the ones we must keep informing. And since new ones appear alm$ost daily it's a never ending battle to keep them informed.

Subject: [baofeng_uv5r] Inserting rows with the Chirp softare

  Hi,
I am relatively new here, been mostly lurking for the last month. I purchased one of the UV-5Rs via Amazon and am taking my Technician exam this Saturday. However I do already have a GMRS LICENSE so I used the CHIRP software to load the included FRS/GMRS image on my radio. I want to insert several more rows into the image file so I can add 8 more (repeater) channels with 5 MHZ offets. I'd also like to add NOAA freqs and since I am a PA Fire Police Officer I'd like to add those frequencies too. However the image as it came with the software comes with 22 programmed channels and 3 blank rows. I have tried to copy and paste the 8 GMRS channels into the image so then I would just have to do minor edits on them. The software tells me there are not enough empty rows. I then tried to insert more rows by selecting some rows, right clicking, and selecting insert rows (above or below). Nothing happens when I do this. I did search the message archives

and found 5 messages on this topic but none of them help me. My version of Chirp is 20130717.
If the radio is capable of 128 channels I'd think I could do this.
Can anyone help?
Thanks.
Jim

I received my radio a week ago from Amazon. Same problem with Chirp and factory software. Same error messages. I have the correct Prolific drivers (3.2.2.0) and the cable installed correctly on my Win 7-64 computer. And yes, the plug was trimmed and firmly inserted. I have no audio when the cable is plugged in, as it should be. I too have firmware BFB-297. I'm waiting for a second and different cable. Has anyone gotten firmware 297 to work with software??

I've got three radios with that firmware that program with no issue. I am using a older Wouxun cable though, don't know if that has anything to do with it.

I also use chirp with firmware version BF297.
No problems ..

Start chirp in admin mode and this daily build a try ...

Chad,

That's exactly what I was going to tell him.

Other than the up and down arrows (which are fine), I rarely use the keypad so I'm quite sure it's caused by wear from sliding the radio in and out of my pocket.

Thanks.

Ya I got mine thursday. Loaded the drivers for the usb cable made sure what com port it was on and uploaded from the radio to the program first then went from there and put the channels I wanted in. Once I uploaded first it worked every time. And I have added and changed things a dozen times and each time it uploaded and downloaded every time.

the hint is FIRST UPLOAD to program for your firmware img. and then erase and go from there.

The bottom of the MENU key came off as a small flake of black. It was not actually worn off, more like bad surface preparation before applying the black.

Needs to be in frequency mode group A. Almost always gives a 'failed to respond' on first attempt, works ok on second attempt. Speaker should be disconnected with programing cable attached.

32754. Sync A & B Channels

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-21 19:56:06 UTC
From: k5ilw
Topic: 32754 Message: 32754

Is there a way to sync A & B channels? Here's what I'd like to accomplish:

I'd like a way to see both the name and frequency of a channel, ie K5ILW and 146.94 on the two displays. (Assuming I had a 146.94 repeater.)

Is there some obscure setting that might allow something like this to work?

Thanks,

Not acid, just friction. The E, A, S, D, and C lettering are completely gone on this laptop's keyboard. Just black keys. Fortunately I know what the are.

Backspace, the center of the Enter key, and two spots on the space bar are showing shiny spots and appear to be dishing somewhat. W, R, T, V, and B, as well as I, O, P, B, N and M are also shiny, but so far the letters remain.

This laptop is about 2 years old and this is the third keyboard.

I see this problem on not just mine, but most players' woodwind instruments, and other musical instruments.

It just happens, some people worse than others.

Jim,

I presume by only manually you mean what I've been doing lately (just got the radio on Monday): Set A to Name and B to Freq. Go to, for example, ch 17 on A and then the same channel on B.

That seems to be what Brad wants, but it's not linked or automatic.

As Jiom said there is no way. Say your repeater is on Ch 4. Assuming you are in the A set, push 04, it goes to K5ILW, hit the A/B button, enter 04. Now that displays 146.94. Only way to do it.

Is there a way to sync A & B channels? Here's what I'd like to accomplish:

I'd like a way to see both the name and frequency of a channel, ie K5ILW and 146.94 on the two displays. (Assuming I had a 146.94 repeater.)

Is there some obscure setting that might allow something like this to work?

Thanks,

Doug,

Thanks for this. I hadn't yet learned that you can change channels by inputting the channel number. But, on my rig I have to enter 004 to get it right. That's not too hard. :-)

On my radios, on the freqs I use all the time, i use the freq numbers as the name. On the others, I use either the call sign of the repeater or the area it covers as the name. If I want to know the freq, just take a couple of steps in the menu system to check. Not that hard or inconvenient to do.

Brad,

As others have already stated, there is no current way to automatically "sync" the name to the actual frequency (nor is there a magic button to push that shows you the frequency underneath the display name). But once you get used to having VFO A show the name and VFO B show the frequency, if you want to find out what frequency is underneath the display name of memory 39 (for example) in VFO A, switch to VFO B and type 039 (remember you have 128 memories so you must type 3 digits). Now VFO A will show the name and VFO B the actual frequency.

I do agree it would be nice if Baofeng actually implemented the feature you want, perhaps some future programming revision will include it someday. Until then, we make do....

PROJECT
MANUALS FOR CHINA BUILT RADIO GEAR

If you own a China built hand-held and have
questions that the manual does not answer,
there's now a new source of information. Calling
itself the Radio Documentation Project, this
website plans to provide high quality and
in-depth open source documentation user manuals
for mainland-China built handheld two-way radios.

Its first completed work is a PDF file containing
a well documented manual for the popular Baofeng
UV-5R dual bander. The instructions are clear
and distinct. Best of all it is available as a
free download at tinyurl.com/new-uv5r-booklet. (Southgate)

When I bought my UV-5R, I bought a mini-magmount type antenna, and never had much joy with it, in fact it was absolutely useless. Recently I had a look at it again. First thing I did was check the swr, hey 1:1.8. Brilliant!. Then I did a continuity check, perfect, or at least lower than 1 ohm. Next I checked between the centre and screen again less than 1 ohm, should have been infinity. Why was the swr so low, simply the co-ax supplied was phenomenally lossy at 145MHz, in fact looking at the construction it would probably have been lossy at af! If it hadn't been so lossy, the rig would probably have fallen off it's perch on transmit.

Dale,

As your senior by one year I am here to tell you that you will soon have your Mac running CHIRP and programming merrily along.

The first hurdle is getting the USB driver on the Mac and is dealt with here:
http://sourceforge.net/projects/osx-pl2303/files/osx-pl2303/0.3.1/

Download and install the driver.

If you don't already have CHIRP for the Mac, go here:
http://chirp.danplanet.com/projects/chirp/wiki/Download

Scroll down to Mac OS. You will see that you need the "KK7DS Python runtime", so download and install that. Then download and install the Application package in the same paragraph.

I just did this a couple of days ago and all was fine. If you have any problems at all, don't hesitate to contact me, either through the group or directly.

Stephen,

I'm not entirely clear on the situation with the mag mount you have. On your SWR measurement, I presume you were testing the antenna and it's coax? On your continuity check, I presume you are only testing the centre conductor of the coax, end to end? But, your check from the centre to shield, was this with or without the antenna connected to the coax?

I agree with Larry that many short antennas have a coil in them, but this is typically in series with the vertical driven element. In other words, if you measure the resistance of the antenna alone, from ground to centre at the coax connection point, it should be approaching infinite. (To be clear, I am NOT suggesting you measure from the centre at the coax connection, to the top of the whip, which SHOULD be close to zero ohms.) Pull the stock antenna off your Baofeng, which contains a coil, and you will see this is the case. If your mag mount reads 1 ohm or less then I'm of the opinion it has a problem.

That depends entirely on HOW the new user prefers to drive himself crazy -- trying to follow the detailed directions for manual programming (which work if you DO follow them exactly) or fighting with the USB drivers (which work if you follow those directions exactly) plus the arcane column names and interactions of Chirp.

Bottom line -- no matter how a new user chooses to program these radios they need to read and follow the directions on the Miklor website.

Date: 2013-08-22 22:13:27 UTC
From: tenorman1952
Topic: 32754 Message: 32799

At first I had wished for a way to sync the A and B displays, but really, I have found that I don't care what the frequency is and seldom need to know. I have it programmed in along with tone, etc. I don't care what the call sign is. What I care about is WHERE the repeater is located and how active it is, how much used, am I likely to reach anyone on it.

I use names only for repeaters, and do not use the call signs, but rather an abbreviation for the town where they are located. Near my QTH, the Morgan City repeater is named simply MCRPTR. Houma is HOUMA. Thibodaux repeater is THIBRP. Franklin is FRANKLN.

In cases where there are more than one in a town, I use two initials for the town, and the remaining indicated freq... such as a repeater on 146.820 in New Orleans would be NO6820. I know the first two digits are 14.

Other cities, where I have a preference, know which are active and which are not, for example I have the repeaters for Lafayette named LAFSKY (Lafayette Skywarn), LAF2, LAF3, in order of my preference. If I really need to know the frequency, and I haven't needed to yet, I can use Menu 21 or 22 to find out.

Firmware Version BFB297

LED light has since gone out and will not turn on. LOL

Have only manually programmed this radio. NEVER tried the software.

Well, I tried it once and this was my result:

When I opened the VIP software the entire computer screen flashes on and off!

CONTROL + ALT + DELETE

Not to panic.
It flashed because it was searching for the Com Port.
This requires that the programming cable be plugged in.
If it can't find the cable, it times out after about 10 seconds.

kristoff,

I'm not sure what you are getting at. This is not my project. I merely pointed out that the recent Amateur Radio Newsline report made this project appear to be something brand new is in error.

This project was made public near the end of last year. Within hours of the v1.0 manual being released, I downloaded a copy, marked it up and contacted the author to let him know where the copy could be downloaded (it was too large to email). I got a reply and a thank you. Thinking that we would all soon be getting an outstanding manual for the UV-5R, I made a small donation to the project. There have virtually not been any activity with the project since. The v1.0 manual was (and still is) a great start and well worth my tiny donation. I just wish that the interest in project by the original person(team) would have lasted a month or so longer.

Do to some prodding by others (that you), I have updated my annotated copy of the manual a few times since then. It is still available on the Miklor.com website.

The problem most people have with manual programming is a preconceived and incorrect notion of how the manual programming process should work. All they need to do is unlearn what they think they know and follow any one of the several good guides that are available on the Miklor.com/uv5r/ website.

Another thing is that if you are vision impaired, using programming software may not be an option. One of the earliest good programming guides was written by a Buddy, a blind ham, to guide you through the process of successfully programming your radio with your eyes closed!

And after monitoring this group for 17 months, it isn't hard to realize that getting started with programming using a computer is not always a "walk in the park".

Interesting, I hadn't thought about using my Mac Mini to program my Baofeng. I downloaded the Prolific driver, Phython and Chirp. I installed Python and Chirp and plugged in the radio. The radio instantly went into transmit mode. Chirp only shows two ports and both are Bluetooth. I realized I forgot to install the driver, so I went back and installed and rebooted. When I run Chirp it only shows the two Bluetooth ports. When I plug in the radio, it still goes into transmit mode (PTT). I unplug the USB connector from the Mac and it stops transmitting.

I'm using the Prolific drivers for my PCs without a problem. Any idea why I don't see the correct port (assuming it won't be listed as Bluetooth) and why it forces the radio to transmit?

Hi,

My USB Programming cable arrived today and I installed the drivers in my computer downstairs from the miklor web site. It took a bit of fussing, but it went O.K. The CHIRP Software has a lot of options and I look forward to exploring them.

I decided to try the setup from the mini CD supplied with the cable and that was virtually seamless. Very easy. I'm running Win/XP in this old DELL D610 and VISTA Ultimate on the machine downstairs. I'll be ready to bring up my Win-8 box in a few days and am curious as to how that will go.

The mini CD has the BOAFENG software and the driver installation in a file called "XP Set", if memory serves, but it did go quite well, much to my surprise.

Thought you guys might be interested in that little tidbit.

Two reasons:

1) Most newbies have loads of trouble getting their software drivers properly installed to work with their $3.00 clone cable, which wastes hours of their time, and

2) It's always a good idea to know how to properly program your radio in the field if you need it, since few folks carry a laptop and cable with them when their out traveling, camping, on the lake, etc., etc.

It might be helpful if the newbie had no previous radio programming experience, there would be nothing to unlearn. I could not program my BCT15 scanner (so I sold it), but programming the UV-5R manually was not a big problem for me. Jim

Hi Leo,

I'm not sure why your radio goes into transmit mode when the USB is plugged in, but I suggest you follow the suggestions of others here.

As far as seeing the Prolific driver on your Mac mini when you Upload/Download from CHIRP, you have to have the radio plugged in and turned on for the PL2030 to show up as a 3rd option for Port. (It's actually listed as "/dev/cu.PL2303-000021A") Otherwise you will only see the two Bluetooth options.

If that doesn't work for you, and if that same USB cable works on your Windows machine, then I might suspect that it isn't plugged in far enough? This might solve both problems, if that is the case.

Are you using a USB cable from Baofeng or an after market one?

Let us know how you sort it out.

I ended-up with one of these sub-generic programming cables, I think
from EBay:

When I plug the cable into the USB port, and then connect the UV-5R,
the radio goes into transmit mode. My other cable from Amazon does *not*
do this.

If I plug the USB cable in, and not plug in the radio, and try to
upload from CHIRP (which fails), I can *then* plug in the radio, and it
will not stay in transmit mode, and I can upload from CHIRP.

I believe it is a sub-optimal cable that is the culprit. I'll get some
details on what they are when I get near them. This behavior is
super-annoying, but you can still program the radio wtih the cable.

CHIRP, OSX, UV-5R, licensed HAM since July last year

Most antennas use a coil that is in series with the vertical element to ground and the center conductor is tapped 50 ohms impedance not resistance above ground. This gives you a driven element that is at DC ground potential . One benefit is low noise as there will be no static buildup.

I don't know. Myself, I've used their 5/8 Slim Duck UHF on GMRS for years on my commercial Kenwood radios. I have consistently had excellent reports. Since I've never used their 270A, I have no experience. Instead of trying to second guess your problem, why not give them a call, they show an 800 number. Since they offer two different SMA Female bases, you might very well have the wrong one.

  For me the issue is not the gap...but rather the fact that with the Smiley antenna I hear Nothing....compared to the stock antenna....

Problem solved!! The second cable from Amazon:
http://www.amazon.com/gp/product/B00CP0I474/ref=oh_details_o00_s00_i01?ie=UTF8&psc=1
worked instantly with no issues. So many hours wasted over the previous bad or incompatible cable (the $7.38 one).

I have the correct Prolific drivers (3.2.2.0) and the cable installed correctly on my Win 7-64 computer. And yes, the plug was trimmed and firmly inserted. I have no audio when the cable is plugged in, as it should be. I too have firmware BFB-297. I'm waiting for a second and different cable. Has anyone gotten firmware 297 to work with software??

Hi Eric,

I can say that the antenna on my Baofeng does not comply with your suggestion. The same holds with the antennas on Wifi adaptors, if you measure from the centre to ground you will get resistance approaching infinite. So, at the least "most antennas" can't be correct. Some may be, but I haven't run into one yet. :-) If you can point me to some, I would appreciate it.

I find most of the programming instructions unnecessarily complicated. It's really simple. I programmed half the channels in mine with simplex, repeaters with the proper tone codes in about fifteen minutes. I think instruction manual writing is a lost art.

Sorry , I Have been away from the hobby for a while. I should not have said most. With all the cheep import stuff they don't use good engineering practices . I should have said a good properly designed mobile or base antenna longer than 1/4 wavelength is at DC ground to prevent noise. You can find info in ARRL handbooks going back to the 50s if you are interested. Most Larsen,Maxrad... 5/8 wave antennas are tapped coils. I would not buy a mobile antenna longer than 1/4 wave that was not at DC ground.

I've now dismantled the antenna in question. It is a shortened 1/4 wave whip with a loading coil near the base wound into the element. I found that the screen was simply connected to the magnet. The short was where the ultrathin co-ax entered the base.

Hi Stephen,

I admire a man that digs right in to find the problem! :-) I have two clarifying questions. First, the 'less than one ohm' that you originally read across the antenna, was a result of a short caused by some failure of the coax? Secondly, I'm assuming the 'screen' you mention is the braided shield layer in the coax?

Thanks,

Stephen

When you break it down to the basics, it is easy to do manually. You need the rx freq, offset, if there is a tone, and what tone. Make yourself a cheat sheet so YOU can understand it. I just go through the menu items until I find one of those parameters and make the change. Not so hard. Not as easy as an FT-60, though.

Hello all,

I have a friend who has a UV5 that will not transmit out of band on the UHF side. On VHF it transmits fine up to 173.00 MHZ. On UHF it will only transmit from 438-499.500 MHZ.

Any ideas as to what might be wrong?

Steve W4YJ

Date: 2013-08-23 12:50:54 UTC
From: Michael Black
Topic: 32826 Message: 32830

I assume you mean UV5R?

Check the step size (Menu 1) and I'll bet it's set to 50kHz which would explain why anything you enter from 499.501 to 499.999 will show up as 499.500.

Set it to 2.5kHz and you should be able to go to 499.9975MHz

On the lower end you should be able to go to 400MHz - you can check the band limits with Chirp - they are in the "Other Settings" tab.

Or are you saying you can enter a freq lower than 438 or higher than 499.5 but the radio just doesn't actually transmit? 438 seems like a really strange cutoff freq.

Thanks Stephen,

I tried again and had the same problem. I don't believe it's an issue with the cable since I used it earlier this week to reprogram the radio. I'm wondering if it's a problem since the mini has USB3 ports. I'm going to play more this weekend and I'll bring it into the office where I have a bunch of older Macs to see if I have the same problem.

I will take your suggestion and read the rest of the thread to see if anything there will help.

Leo

If you are programming repeaters, you don't even need the offset. Come to think of it, you don't need that for simplex either :) Just for the VFO.

I just think the explanations get awfully involved for a newbie and are overly complicated. I find no reason to have to mess with getting the right cable, install the software making sure Windoze doesn't change the driver, get the cable to plug in all the way, etc. when I could just program the thing. Yes, the manual sucks. But some of the online instructions suck just a little bit less rather than a whole lot less. Just my $ 0.02.

The normal UHF RX/TX band limits for a current UV-5R are 400-520 MHz. Older units were set to 400-470 MHz but are easily changed to 400-520 MHz using the Baofeng VIP software or CHIRP.

Are you saying he can tune the VFO from 400-520 MHz but can only transmit from 438-449.500 MHz? That would be highly unusual because as far as I know, there has not been discovered a method for setting the RX and TX band limits to separate values.

So if the VFO RX and TX are limited to 438-449.50 MHz, then this can easily be edited using the Baofeng VIP or CHIRP software. If it is only the TX range that is limited, I would very much be interested in your friend downloading his current radio channels and settings using CHIRP and email the saved image (*.img) file to me for evaluation.

Leo,

Where did you get the driver for the programming cable that you are using on your Mac? If you are using a cable with the unauthorized CHIP (most are), you have to use a particular driver just like you do on a Windows PC.

So if you haven't already, I would recommend that you try one or both of the drivers listed on the CHIRP wiki's "MacOS Tips" page...

In Device manager...
Is there yellow triangle with an exclamation point [!] in it?
What driver version is installed?
What COM port has been assigned?
Which software and version are you using (Baofeng CPS and/or Baofeng VIP and/or CHIRP)
What error messages are you getting?

Most of the time, if the cable (or in this case cables) are not defective and the correct driver is installed (v2.0.2.1 for most cables a Prolific type chip), the problem is that the cable is not fully plugged into the radio. It may look like it but give it an extra wiggle and a firm push. We often get reports back the the user was amazed when what appeared to be a fully plugged in cable finally snapped in.

I agree with the other post. The two biggest issues with the Bofeng programming cable are:

1) Making sure the cable is connected to COM 1 in the device manager.
2) Making sure the cable is fully seated in the HT itself.

There are instructions for both of those things in the 'files' section of the group. When I got started, those docs were what I used. I followed them and they worked.

I hope you are able to get it working, it's terrible to have to program the 5R through the radio directly.

Buy a "real" Prolific cable or FTDI cable (even better) from Kurt at TOC
and eliminate your cable issues. By the way, for the purposes of
programming your radio, your Mac having a USB 3.0 port makes no difference
at all.

I agree with Craig here. Move often than not, COM1 will already be occupied by some other device.

Depending on the Baofeng software that you are using, it may default back to COM1 every time you launch it. That means that if your programming cable hasn't been assigned COM1, then you have to change the software to the correct port every time the program is loaded. The Baofeng VIP software for firmware versions BFB290 and older does this.

So if you can rearrange your COM port number so that your programming cable is assigned COM1, it could be convenient. But if you shuffle them around, you run the risk of making it difficult to use whatever device that used the port that you moved to make COM1 available.

The first Baofeng software for the UV-5R only went to COM8. My cable was assigned COM13 so I had to uninstall some software I no longer used and reassign some ports to get my cable assigned a port that was in range of the software.

The current OEM software versions go to COM16. So any COM port in that range should work. CHIRP, on-the-other-hand, supports COM ports all the way up to COM256. So try to stay within the range of COM1-COM16 if you want to be compatible with both CHIRP and the OEM software.

Thanks Paul and everyone else that responded to this thread. I like your idea of combining the location and freq as the name. I'll take a look at that. I travel a relatively wide area and probably need to group all my frequencies according to location, like abq694. (Albuquerque 146.94)

Thanks again,

Brad

I've got a contact at Baofeng and I sent them this suggestion which they
said they'll pass on to their engineers.too bad firmware isn't upgradable.
Not that I'm holding my breath for them to make the change:

Would be nice to be able to see Freq/Name for each VFO.

So.options like this:
MDF-A or MDF-B: Freq,Name,Chan,Freq+Name,Chan+Freq,Chan+Name
MDF-A-TM or B: seconds

Display would then alternate between the two for N seconds each.

Hi Leo,

I was able to help Dale, who posted with the Subject "programing the uv-5r with my MAC mini" yesterday (see his post below), and he has his setup working now, on his Mac Mini.

As I said earlier, the 'going into transmit' and not being able to "see" the radio with CHIRP, both tend to suggest connection issues with the radio. If you have no reason to believe that the cable might have been damaged since you used it to program with your PC, then you have a mystery.

If you can think of anymore 'clues' please post them. Many of us love mysteries.

Had a friend give me his radio to troubleshoot and I can not get into the menu button. Keypad is NOT locked. Also when trying to program the radio it will not communicate with this specific radio but software/cable works with another radio of the same model.

Would like to do a factory reset but not sure how to do this since I can't get into the menu or reprogram the radio. Any combo of buttons to push/hold down or anything else that will allow me to get it factory reset would be greatly appreciated.

By the way, the radio receives/transmits fine on what is programmed into it.

Owner is not sure what software was used to originally program it. I have tried Chirp, VIP and factory software to no avail.

Thanks
Ray

Try using Isopropyl alcohol 99% pure (you can get it at the pharmacy, tell them it’s for cleaning printed circuit boards, it will Not be on the shelf) in a syringe around the MENU button and flush it well it will not hurt anything.

This mite get the menu button working again.

Ray,

There really isn't such a thing as a 'factory' reset. All it does is erases the channels and sets the menus to the firmware defaults (which are different that what they were set at from the factory).

Are you able to get into VFO mode. The reason I ask, is that there is a software setting to disable the [MENU] button. The [MENU] can be disabled with either the CPS, VIP and CHIRP software. But the setting is only effective in channel mode. Once you switch to VFO mode, the [MENU] button becomes available regardless of the setting.

It sounds like the speaker/mic socked might have an issue. It seem that there are a few radios recently that may have the contacts in the socket deeper than normal and the programming cable plugs can't quite reach them. Have you tried a speaker/mic?

You might have to try using a programming cable with separate 3.5 MM and 2.5 MM plugs. There are pictures of the one that I made in the group files ares.

Hopefully if you can get computer access to the radio, the closest thing you can get to a 'factory' reset is uploading a CHIRP image that was saved from the radio immediately after the radio was connected to the battery for the first time. If you don't have that (most don't), then the next best thing is to upload the CHIRPrecovery image from here that matches the firmware version of the radio.

From: Kuby
Topic: 32859 Message: 32859

Has anyone seen an 'aftermarket' clip/slide-on charger for portable/traveling use? I hate to drag that charge stand around.

Looks like the battery packs have molded slots in them for just this type of aftermarket goody.

Yes, I know I could go to the much bigger 3800mA battery packs with one having a plug-in cigar cord, but that just that much more suite case space/weight and another expense.

32861. FCC Type acceptance?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

I saw a friends UV-5R Plus yesterday and it had an FCC part 90 sticker under the battery FCC number and all. I purchased the UV5-RE Plus after searching for the differences on the internet and finding numerous sites that indicated the only differneces in the model numbers were cosmetic. The 2ea UV-5RE Plus radios I got do not have the FCC type 90 sticker or FCC type acceptance number. Does anyone knwo if the UV-5RE Plus is type 90 accepted? If not that word needs to be gotten out as a signifigant difference and not woth the $6 I saved on two radios. Thanks.

It looks like the problem is the cable. I plugged it into my laptop that I used earlier this week to program the radio and it does the same thing. Time for a new cable.

Can someone send me a link for a good cable the the uv5R?

This is the one that I bought.

http://www.amazon.com/gp/product/B008RZJHJU/ref=oh_details_o07_s00_i00?ie=UTF8&psc=1

Thanks,

Leo

DE,

The majority of the sellers of BaoFeng radios on eBay and Amazon are Chinese Trading Companies, who have no understanding of the vale or need for an FCC certification. They are buying radios in large quantities and distributing them into all parts of the world. Only a small percentage of the business us interested in or needs the FCC part 90 certification labels, so they do not order their radios so labeled.

The only FCC certification I have seen is for the UV-5R, and is labeled that way, and UV-5R is printed on the FCC Part 90 labels. Are the other models, i.e.: a, A+, B, C,D,E,E+, etc. legal to bear the FCC Part 90 certification, I really don't know, nor do I care to worry about it.

We choose to stock the UV-5R in all 5 available colors and every one of our UV-5R are specially ordered and labeled with the FCC Part 90 certification labels, additionally all of our radios are ordered with the UV-B5 antenna, which is the thinner, slightly longer antenna. This antenna has shown to outperform the shorter and fatter standard UV-5R antenna.

We also stock other models, like the BF-F8+ and BF-F9, with both white on black LCD and the tri-colored backlit LCD panels, also with the upgraded antennas, but without the FCC Part 90 labels, as these are not really UV-5R radios, even though the circuit boards inside the shell are identical, as are the features and accessories.

So I guess what I am saying is that if you are interested in having a radio with an FCC Part 90 certification label, you might need to deal with a vendor that understands your needs and bothers to provide what you are looking for. Yes the price might be a few shillings higher, but I believe the interest in getting you what you need and the local service including a telephone number you can call during daylight hours just might be worth the extra few dollars. Let alone the fact that your purchase will be delivered within 1 to 3 days normally, via USPS Priority Mail.

Leo & All,
The cable from Amazon that you listed is the same one I bought first, and I spent many hours trying to get it to work with Chirp and Baofeng software without success. I sent it back and got this one:
http://www.amazon.com/gp/product/B00CP0I474/ref=oh_details_o00_s00_i01?ie=UTF8&psc=1
It worked first time out of the box. I should have ordered the more expensive one to begin with.
A word about serial ports. It does not matter what port is used as long as it is in range of the software program you are using it with. You can set the Prolific driver software to use any port, even if Windows reports that it is in Use. You will get a nag saying the port is in use, but just force it to use that port anyway.
Jerry K7OQV

Check your driver. What OS? (Re-)read the miklor site, specifically
driver installation and setup.

If you follow the directions to the letter, you should be fine.

Did not know about the VFO/MR part so I tried that and cannot get into vfo mode. Holding the #3 button down while powering on the radio gives me USA349. I suspect this might be one of the F-11 Radios??

Will try the separate cables and see if that does any good.

Any other suggestions other than throw it against a wall?

Ray KJ4BJO

On Fri, Aug 23, 2013 at 1:27 PM, <rhughes3@...> wrote:

Had a friend give me his radio to troubleshoot and I can not get into the menu button. Keypad is NOT locked. Also when trying to program the radio it will not communicate with this specific radio but software/cable works with another radio of the same model.

Would like to do a factory reset but not sure how to do this since I can't get into the menu or reprogram the radio. Any combo of buttons to push/hold down or anything else that will allow me to get it factory reset would be greatly appreciated.

By the way, the radio receives/transmits fine on what is programmed into it.

Owner is not sure what software was used to originally program it. I have tried Chirp, VIP and factory software to no avail.

Thanks
Ray

Ray,

There really isn't such a thing as a 'factory' reset. All it does is erases the channels and sets the menus to the firmware defaults (which are different that what they were set at from the factory).

Are you able to get into VFO mode. The reason I ask, is that there is a software setting to disable the [MENU] button. The [MENU] can be disabled with either the CPS, VIP and CHIRP software. But the setting is only effective in channel mode. Once you switch to VFO mode, the [MENU] button becomes available regardless of the setting.

It sounds like the speaker/mic socked might have an issue. It seem that there are a few radios recently that may have the contacts in the socket deeper than normal and the programming cable plugs can't quite reach them. Have you tried a speaker/mic?

You might have to try using a programming cable with separate 3.5 MM and 2.5 MM plugs. There are pictures of the one that I made in the group files ares.

Hopefully if you can get computer access to the radio, the closest thing you can get to a 'factory' reset is uploading a CHIRP image that was saved from the radio immediately after the radio was connected to the battery for the first time. If you don't have that (most don't), then the next best thing is to upload the CHIRPrecovery image from here that matches the firmware version of the radio.

I've been away from the hobby for a few years and just recently purchased my 2nd Baofeng that I am having a ball with.

I would like to use the second unit as a base station style operation on my desk with a copper cactus mounted outdoors. I've been away from the glossy mags for a few years. Can anybody point me towards an inexpensive, filtered power supply capable of handing the 4W output of the Baofeng. Nothing fancy expected, just a unit for a casual user that will allow me a clean signal? Nothing fancy needed. Thanks!

I love this newsgroug. Lots of info and more enthusiasm than I've seen around amateur radio for a long time. 73/Gary/WT8P

There is special software on the Import Communications website that allows you to disable this feature. CHIRP should also be able to disable this feature. That is, if you want to disable it.

Your mission is to get the programming software working or you will not be able to do much of anything with this radio.

Before you throw it against the wall, I wouldn't mind having a go at it.

Great minds think alike! LOL Just got off of Ebay where I ordered the battery eliminator for around $6.50 (not bad, I think?) My next step is still contemplating how to keep that sucker supplied with DC at my desk. I know years ago that I had an inexpensive one that worked fine for years. I've just been away so long that I'm not sure whether to try Ebay/Amazoning it.....or going towards a comm/electronics joint. I'm cheap! :).....so I'm up for any workable solution that won't break the bank. (Or more importanly, not burn up the radio or have a lovely 60hz hum accompanying me on the air.;) Thanks for the input.....Gary

Maybe, because my Baufeng came with a wall-wart charger, I presume everyone get one. No? Yes? I also bought the battery eliminator with cigarette lighter plug for in the vehicle.

So, why not use the charger that comes with the radio? Or is the intention to turn it into a desktop radio with it's own mike and speaker? I have mine setting on my desk, in it's charger, near a window and if someone I want to speak with comes on, I remove it from the charger and talk. No 60 hertz (actually 120 hertz) hum from the battery.

But, I must be missing something?

32883. Nagoya NA-771 Blue label teardown photos

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-24 03:51:52 UTC
From: <bjostad@...>

Attachments: 1 described; binary payloads are missing from this source WARC

I looked everywhere online for some photos of this, and since this one did not work for me at all I decided to tear it apart and post the photos for reference.

I apologize if something like this has already been posted but I could not find it anywhere.

I bought this to use with my Baofeng UV-5RE Plus and it didn't even come close to the performance of my stock antenna (mine came with the longer baofeng antenna). I tried it with 2 different SMA to BNC adapters just in case, but that should not be an issue as the adapters work fine with my other BNC antennas. Since this thing was garbage I decided to tear it apart. The seller is sending a replacement for free so we shall see if it is any better, but I'm not hopeful about that one.

Anyway here are the photos, I hope they are of some help to somebody in the future. The full size versions are located in the photos tab for the group

or just use a standard battery charger hooked to a wet cell battery with a cigarette lighter plug and the battery eleminator. the wet cell battery works as a filter.

As suggested before, get a little 3 amp supply from Radio Shack or Samlex, etc. with the cigarette lighter socket. Should be plenty. The reason the wall warts don't work is they only put out less than 1/2 watt when you need about 2 to transmit.

> Thanks again,
>
> Brad
>

Brad, something else I do is program from CH-100 through CH-127 with the simplex frequencies. That way I don't have to remember the spacing, etc. I do it like this:

The first two digits of the 2m Simplex frequencies are replaced with the letters SX, for SimpleX. In CH-100 146.400 is named SX6400. I know instantly that SX6400 is a SimpleX channel, and it is 146.400 mhz. Next is CH-101, 146.415, named SX6415. Etc.

These are CH-100 through CH127 in my radio, put them where you want.

146.400 mhz = SX6400
146.415 mhz = SX6415
146.430 mhz = SX6430
146.445 mhz = SX6445
146.460 mhz = SX6460
146.475 mhz = SX6475
146.490 mhz = SX6505
146.520 mhz = SX6520
146.535 mhz = SX6535
146.550 mhz = SX6550
146.565 mhz = SX6565
146.580 mhz = SX6580
147.420 mhz = SX7420
147.435 mhz = SX7435
147.450 mhz = SX7450
147.465 mhz = SX7465
147.480 mhz = SX7480
147.495 mhz = SX7495
147.510 mhz = SX7510
147.525 mhz = SX7525
147.540 mhz = SX7540
147.555 mhz = SX7555
147.570 mhz = SX7570
445.000 mhz = 445MHZ

446.000 mhz = 446MHZ
446.500 mhz = 446500
446.520 mhz = 446520

For the Marine frequencies, I use MAR13, MAR16, MAR22A, etc.

Weather channels, WX1, WX2, WX3, etc.

Paul - AE5JU

Yes, North American line voltage is typically 60 cps 120 VAC. But, it
is my understanding that what is commonly called "60 cycle hum" is
usually 120 cps in audio frequency.

Does that mean we're both right? :-)

32890. Re: [baofeng_uv5r] Power Supply for home (base station style use). Not for charging.....

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-24 07:20:48 UTC
From: Scott, KB3JQQ
Topic: 32874 Message: 32890

60 cycle AC becomes 120 Hz pulsating DC when full wave rectified,
then the filter capacitor(s) fills the space between the pulses.

I would get the battery eliminator and a power supply that has a car lighter socket built in the top of the supply.

You could get the extended battery and a side charger battery adapter too

I like the small power supply with the led acid battery as a filter and backup power supply for power when an emergency occurs.
That way when you check into an ARES (Amateur Radio Emergency Services) net you can claim emergency power available.

Thanks to everybody for the suggestions and thoughts. It sure is refreshing to find a group that is commonly interested and enthusiastic about our hobby. All that coupled with great info on helping us all tackle the somewhat/sometimes cantankerous Baofeung line of radios is what I remember being the most enjoyable part of being a ham operator.

Doug, I decided to take your suggestion and plopped down $28.56 for the Pyramid PS9KX 5A/7A Power Supply with Cigarette Lighter Plug. Thanks for the suggestion.

snoopy_doopy: A roll up J-Pole is exactly what I decided would be best for my limited space operation and have found that it works respectably on both 2M and 440.

The battery charger/lead battery (filter) combo is a method that dates back many years for me Larry. I used to run a 2M amplifier with that setup. It worked great for years. (Ex-wife never did appreciate how nice it looked though.....)

With the Pyramid power supply due to arrive Monday.... If any of you hear about somebody punching a hole through the ionosphere a couple of miles from the Indianapolis Motor Speedway.....you heard it here first! ;) 73/Gary/WT8P

One very good reason to NOT do that is that the charger will not be able to correct for the draw from the radio and according to the Battery University will lead to either overcharging or repeated charge cycles, killing the battery.

I thought about doing that too, but not now.

Stan

Subject: Re: [baofeng_uv5r] Power Supply for home (base station style use). Not for charging.....

Maybe, because my Baufeng came with a wall-wart charger, I presume everyone get one. No? Yes? I also bought the battery eliminator with cigarette lighter plug for in the vehicle.

So, why not use the charger that comes with the radio? Or is the intention to turn it into a desktop radio with it's own mike and speaker? I have mine setting on my desk, in it's charger, near a window and if someone I want to speak with comes on, I remove it from the charger and talk. No 60 hertz (actually 120 hertz) hum from the battery.

But, I must be missing something?

Yes, That firmware version 00 together with the “F-11” label on the front of the radio would indicate that it is an F-11 and that it needs the special F-11 software (or the latest daily build of Chirp)

From: rhughes3@...
Did not know about the VFO/MR part so I tried that and cannot get into vfo mode.

Holding the #3 button down while powering on the radio gives me USA349. I suspect

this might be one of the F-11 Radios??

Only if your understanding is based on tone deaf hams -- which is quite possible since I doubt that the majority of recently licensed hams even know what either hum sounds like or what could cause it.

-----Original Message-----
From: Stephen Wandling

Yes, North American line voltage is typically 60 cps 120 VAC. But, it is my understanding that what is commonly called "60 cycle hum" is usually 120 cps in audio frequency.

Does that mean we're both right? :-)

Topic: 32784 Message: 32900

A couple of caveats. First, just because other Mac users here got it running with the Miklor documentation or the sourceforge drivers or whatever doesn't mean you will. You've got to be very specific about the hardware you're using and get the instructions tailored for that equipment.

My experience with several Macs was that at least with Mountain Lion if you installed new (i.e most recent) official Prolific drivers and then tried to use a cable with a Prolific CLONE chip it wouldn't work; and then you could NOT go back to an earlier driver as you could with a Windows box, and hence the Prolific clone cable wouldn't work. I spent a couple of hours with Terminal rm'ing all sorts of system file from kexts to prefs to BOMs and never had success. I have other serial/usb cables and that may be a source of the problem, but start with the sourceforge one or an older (1.4?) version and go from there. Assuming you are using a Prolific clone or Prolific cable; mine is from another vendor so you may have to find other instructions if you're using say a Kenwood cable.

I'd think the way to go would be the battery eliminator and then any 12v power source into the cig plug. You might be able to rig a 10v source to the battery itself, but look at the circuitry of the cradle first, since it will reveal what's needed. You don't wanna ignite the battery.

Although these days the radio is so cheap it might be better to buy another one and always have it charging…would only cost about $15 more. Amazing.

Rob

And just look what they've missed! And fifty years from now folks will
be laughing at our 'ignorance'.

Speaking of tone deaf, I am. To enable a good zerobeat, especially on
CW, I use an NEScaf audio filter from NEQRP. It can clamp down to about
60 hz of bandpass. Sometimes I switch the filter out and see if I can
'guess' the correct tone, but I'm almost always way off.

But, that's a bit off topic for the BaoFeng group.

Did you find any fault causing the low performance? I purchased one with my radio as well, but it is not as good as the shorter Baofeng antenna. A real disappointment. I was told the Nagoya antennas were good, but I think I should avoid the brand in the future. --- In baofeng_uv5r@yahoogroups.com, wrote: > > > I looked everywhere online for some photos of this, and since this one did not work for me at all I decided to tear it apart and post the photos for reference.

I apologize if something like this has already been posted but I could not find it anywhere.

I bought this to use with my Baofeng UV-5RE Plus and it didn't even come close to the performance of my stock antenna (mine came with the longer baofeng antenna). I tried it with 2 different SMA to BNC adapters just in case, but that should not be an issue as the adapters work fine with my other BNC antennas. Since this thing was garbage I decided to tear it apart. The seller is sending a replacement for free so we shall see if it is any better, but I'm not hopeful about that one.

Anyway here are the photos, I hope they are of some help to somebody in the future. The full size versions are located in the photos tab for the group >

32905. low voltage warning...battery?

"Low voltage" it is. Time to charge your battery. And then once it is
charged, I would avoid letting it get that low on purpose. Top it off
whenever it is convenient.

Subject: Re: [baofeng_uv5r] RE: Programming / Menu problems

Yes, That firmware version 00 together with the “F-11” label on the front of the radio would indicate that it is an F-11 and that it needs the special F-11 software (or the latest daily build of Chirp)

From: rhughes3@...

Did not know about the VFO/MR part so I tried that and cannot get into vfo mode.

Holding the #3 button down while powering on the radio gives me USA349. I suspect

this might be one of the F-11 Radios??

From what I've read here, there were a few F-11 radios that got out of the factory with the UV-5R badge. There were also a few that had the VFO/MR button disabled at the factory. That made them nearly impossible to use without software.

I'm glad you got it sorted out. Did you use CHIRP or the special Baofeng software?

Looking into buying a Baofeng radio, wondering which model is the best one to get....?

There are so many different model names and reviews on amazon, just looking for the best one to pick up. I hear that some can reach the 520MHz frequency?

Any help on which one to pick up would be greatly appreciated.

Thanks!!!!

Thanks to everybody for the suggestions and thoughts. It sure is refreshing to find a group that is commonly interested and enthusiastic about our hobby. All that coupled with great info on helping us all tackle the somewhat/sometimes cantankerous Baofeung line of radios is what I remember being the most enjoyable part of being a ham operator.

Doug, I decided to take your suggestion and plopped down $28.56 for the Pyramid PS9KX 5A/7A Power Supply with Cigarette Lighter Plug. Thanks for the suggestion.

snoopy_doopy: A roll up J-Pole is exactly what I decided would be best for my limited space operation and have found that it works respectably on both 2M and 440.

The battery charger/lead battery (filter) combo is a method that dates back many years for me Larry. I used to run a 2M amplifier with that setup. It worked great for years. (Ex-wife never did appreciate how nice it looked though.....)

With the Pyramid power supply due to arrive Monday.... If any of you hear about somebody punching a hole through the ionosphere a couple of miles from the Indianapolis Motor Speedway.....you heard it here first! ;) 73/Gary/WT8P

Hello the problem is that the com port in the program is not set to the same com port set by your system when the cable is pluged it.
On UV 5R vip program there is a communication port setting and it lists 8 ports on my computer and try each on and them attempt to read the radios information .if com port error comes up , try another port setting ,
I had to use port8 with my cable ,so try to comunicate with each one till you find the right setting.

I couldn't find anything wrong with it as far as its construction. Later this week I will take some measurements and do some math to see if I can make this thing resonate reasonably. I'm looking to use this for 2 meters and don't care so much about UHF. If it comes to it, I will try shortening this to match the NA-701.

One of the things I am wondering is if the receiver is have desense issues with this antenna. Commercial FM in my area has a few station that are so powerful with this antenna I can find them on 4 or 5 frequencies, sometimes overpowering other stations completely.

It might be a week or so, but I will post anything I find.

--- In baofeng_uv5r@yahoogroups.com, <zl2tpq@...> wrote:

Did you find any fault causing the low performance?
I purchased one with my radio as well, but it is not as good as the shorter Baofeng antenna. A real disappointment. I was told the Nagoya antennas were good, but I think I should avoid the brand in the future.

I apologize if something like this has already been posted but I could not find it anywhere.

I bought this to use with my Baofeng UV-5RE Plus and it didn't even come close to the performance of my stock antenna (mine came with the longer baofeng antenna). I tried it with 2 different SMA to BNC adapters just in case, but that should not be an issue as the adapters work fine with my other BNC antennas. Since this thing was garbage I decided to tear it apart. The seller is sending a replacement for free so we shall see if it is any better, but I'm not hopeful about that one.

Anyway here are the photos, I hope they are of some help to somebody in the future. The full size versions are located in the photos tab for the group

Thanks for the info Rob,

I'm actually located in Wichita, Ks. at the intersection of Interstate 35, 135 and 235. I have 2 FM antennas within 1.5 miles of me, and just an amazing amount of wireless activity all around of course.

I built a couple RTL SDRs, one with the Ham it up converter and built enclosures to shield them from all the noise from the neighborhood. They work great with the shielded enclosures, but were useless here without them.

I'll connect this antenna to one and take some screenshots of the waterfall to see what kind of noise it might be picking up and also what the FM band looks like.

yes, my f11 came with a uv-5r label. there was a note in the box saying there was a factory error but that it was in fact an f11.

in fact, jim used my f11 image file to incorporate this model into chirp.

despite it costing more than some of the other models, i like it very much indeed. it takes the uv5v accessories such as the 3800 battery without any filing and it has the plain speaker grill--i dislike the sort of 'bolted on' grill look of the models after the uv5r although i have one of those as well, the 'custom' one from amazon that comes with the rubber case and the slightly longer antenna. but it's yellow and so that makes up for its ugliness! Attachments: 3 described; binary payloads are missing from this source WARC

I uploaded a few pictures of the SDR with the antenna connected. They can be found in the album here: http://groups.yahoo.com/group/baofeng_uv5r/photos/album/2062300686/pic/list

When I first turned it on it was in the 40 meter band, and I could clearly hear some QSOs with this little antenna. Sounds like there is a contest going on. (The gain was also still at ~30dB)

There are 2 pictures of the FM band and they are booming. The gain is turned all the way down (to 0) and there are still a few stations that are maxing and can be found drifiting around other frequencies when tuning around the FM band.

There is no picture uploaded, but the McConnell AFB ATIS at 124.650 Mhz is unable to be heard at all with this antenna, nor is the KICT ATIS. I also cannot see any Airband activity in the 130-134Mhz range.

The NOAA station at 162.550 Mhz was fairly strong without much noise around it

Finally the last 3 are of the 2 meter band.144.390 Mhz APRS packets with 5dB gain and 30dB gain. and then a short repeater identification at 147.105 Mhz also with 30dB gain. Without the gain turned up there was nothing visible or audible. Using my typical 2 meter dipole I only use 0-15dB of gain (usually under 10dB) to get strong signals. Even with my collinear ADS-B antenna, which is tuned to 1090 Mhz, I get that kind of reception.

I'll attach 3 photos of the 2 meter range, for the rest you will have to go to the link above.

This is of topic, but if anyone has questions about RTL-SDR feel free to ask me directly. For about $20 you can get into it with a ~ 25mhz-2Ghz range, and for about $80 you can setup a real nice 50khz-2Ghz properly grounded and shielded receiver that handles the HF as well. Be careful though, you can spend hours looking at all that is in the air.

Wow, don't use the more options button if you post directly to the group via yahoo (maybe a google chrome issue only?). Anyway here was what the message was supposed to be, hopefully it doesn't get smashed into one big text block.

I uploaded a few pictures of the SDR with the antenna connected. They can be found in the album here: http://groups.yahoo.com/group/baofeng_uv5r/photos/album/2062300686/pic/list

I have my UV5RE+ running with a Signalink USB running AGW Express so I can run RMS Express-Winlink 2000. I used the Signalink because it has PTT built in and does not take away from my audio ports. It works OK but transmit and receive audio are critical, and take some work before a connect is accomplished. This is all on a Dell laptop running WINXP SP3. Thats the basics. More info if needed.

Any thoughts/opinions on the wide variety of carrying cases available for the Baofeng radios? I see that there is an almost endless variety listed on the various sites out here.

Anybody care to chime in with some success/avoid advice on the subject?

I drive a fuel tanker nights, and am looking for something solid, yet somewhat versatile that I can toss over to the passenger seat for the night and try to avoid TOO much of a beating. 73/Gary/WT8P

where everything SEEMS to be working now. Thanks for everyone's help.

From what I've read here, there were a few F-11 radios that got out of the factory with the UV-5R badge. There were also a few that had the VFO/MR button disabled at the factory. That made them nearly impossible to use without software.

I'm glad you got it sorted out. Did you use CHIRP or the special Baofeng software?

Its kinda tricky how you plug in the cable. I found that the only way XP and the radio communicate is for the plug to be plugged into the radio first, then plug the USB connector into the jack. Then I have to check the port settings in control panel because sometimes XP changes the port assignment. Is CHIRP finding the port and no comm with radio or is CHIRP not finding the port?

Many times the USB comm port that finally works won't end up being Comm 1 either....

On Fri, Aug 23, 2013 at 8:23 AM, jbogstie <jason.bogstie@...> wrote:

I agree with the other post. The two biggest issues with the Bofeng programming cable are:

1) Making sure the cable is connected to COM 1 in the device manager.
2) Making sure the cable is fully seated in the HT itself.

There are instructions for both of those things in the 'files' section of the group. When I got started, those docs were what I used. I followed them and they worked.

I hope you are able to get it working, it's terrible to have to program the 5R through the radio directly.

Michael,

You speak about
> the only way XP and the radio communicate
This begs the question, have you had success with CHIRP loading into the radio? In Win 7, if I plug my cable in without it being plugged into the radio, I can see it in Device Manager. So, seeing the cable is different than seeing the radio.

You may have already done this, but connect the radio to the computer, bring up CHIRP, and under Radio select "Download from Radio". You should then see a dialogue box. Select the correct Com port and the radio Vendor and Model. Press OK and the Clone Progress comes up. If the green bar runs across, you're in business. Otherwise, let us know what you experience.

I used my OPC-478 with an IC-2100H. The Icom CS2100 software can only
use a real serial port so it won't work with a USB>serial adapter with CS2100.
I have been meaning to try it with CHIRP using my Keyspan converter. I use
my Kenwood type cable with by BFB231 UV-5R. I've been meaning to try
CHIRP with that, too, but I haven't needed to do any reprogramming of the
radios in a long time. My main use is to talk to my Echolink node with it.

As you can guess, real life takes precedence over playing radio..... :-)

According to the info I've seen from Icom, the correct cable you would need
to use for your 51A is the OPC-2218LU, so it looks like the OPC-478 cable
you are trying to use simply won't work.**

32948. Hello All

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-26 08:33:48 UTC
From: Smokin
Topic: 32948 Message: 32948

Just bought a Baofeng UV-5R and wanted to say hi to everyone. :-)

The last radio I bought was a Yaesu FT-209 HT. When I saw the price of the Baofeng was less than a fill up at the gas station I just had to check it out. While waiting for it to arrive I've been collecting info on the various Baofeng models.

Thank in advance for help and advice
Smokin Paul

Attachments: 1 described; binary payloads are missing from this source WARC

According to the manual for the IC91 you don't use the speaker jack - the data jack is on the side

And you use the OPC-1529R cable:

http://www.icomamerica.com/en/downloads/DownloadDocument.aspx?Document=33

!4DATA JACK [DATA]

Connects a PC through the optional data communication

cable, OPC-1529R, for low-speed data communication or

control the transceiver remotely using the optional RS-91

(OPC-1529R is supplied). (p. 56)

And I don't see the IC-91 listed as one of the radios supported by Chirp

http://trac.chirp.danplanet.com/chirp_daily/LATEST/Test_Report.html -- so unless it's compatible with some other one you'd be out-of-luck unless you want to provide one to Chirp to test.

Subject: Re: [baofeng_uv5r] Baofang and Icom

According to the info I've seen from Icom, the correct cable you would need to use for your 51A is the OPC-2218LU, so it looks like the OPC-478 cable you are trying to use simply won't work.

On Sun, Aug 25, 2013 at 5:20 PM, Scott, KB3JQQ <kb3jqq@...> wrote:

I used my OPC-478 with an IC-2100H. The Icom CS2100 software can only use a real serial port so it won't work with a USB>serial adapter with CS2100.
I have been meaning to try it with CHIRP using my Keyspan converter. I use my Kenwood type cable with by BFB231 UV-5R. I've been meaning to try CHIRP with that, too, but I haven't needed to do any reprogramming of the radios in a long time. My main use is to talk to my Echolink node with it.

As you can guess, real life takes precedence over playing radio..... :-)

My OPC-478 is a serial cable with a single 3.5 mm plug on it.
My Kenwood clone cable is USB and has a Kenwood type 2 pin connector (2.5 & 3.5 mm)

These cables are different animals.

I don't know about "best", but I have one of these that I've been able to program a number of radios.

6 in 1 USB Programming Cable Adapter For Motorola Kenwood Yaesu Vertex Puxing

http://www.ebay.com/itm/261086302729

One of the six plugs is for Icom, and is a 3.5 mm stereo plug. You will have to plug it in and see what port is indicated in Device Manager.

Mike K3MH,

The OPC-478 is the correct cable for programming your IC-91. The cables mentioned by others are either for a different purpose (control & data comm) or for a different radio (IC-51).

However, you must put the IC-91 into "clone" mode before you tell CHIRP to start sending the programming info to the radio. The procedure is shown on page 117 of your IC-91 manual (While pushing [MR] and [MEN/LOCK], push and hold [PWR] for 1 sec. to enter cloning mode). If this isn't done, the radio won't accept the programming info.

73, Jim K5JG

From: Todd Bloomingdale
Topic: 32955 Message: 32955

I would like to know if any of the newer models of the baofeng have fixed the receiving of channels while in scan mode? I am with emergency services and have several channels that I need scanned and my current UV5R skips channels while my other brand radios will stop on a busy channel.

from miklor website:
41
*Q: **My receiver skips over some channels when scanning.
*A: There is a known 'quirk' with the UV5R receiver.
If a scanned channel has an R-CTCSS (PL) tone of 136.5 Hz
or lower, the receiver will not stop on that channel.
R-CTCSS (PL) tones of 146.2 and higher work fine.

Here is a picture.

I tried blowing it with caned air. no go.

I do not even see where something can get into the contacts.

Here is a picture of it.

I recently received a Baofeng UV-5R+ and I really like it it, but I'm really confused on how to program it. The software CD that came with it was no help, I couldn't find the proper software so I took to the internet and found the "Baofeng UV-5RA Programming Software" which I could not download properly, so I turned to Chirp. I input a few frequencies and went to upload to the radio and Chirp would not allow me to upload to the radio. I was hoping someone could help me out with this dilemma, I am green to HAM radio and I would love to figure this out.

Thanks,
Mark

You have to download from the radio first to create a template, add your channels, then upload to the radio.

It's a good idea to save the original, unmodified download so you can restore the radio to "factory fresh" state if needed.

If you haven't already, read the user guide and FAQ links below; it makes the whole process MUCH easier.

Read the radio first, modify the file, then write to the radio.

using uv-5r series program v 12.07.25 still gives "fail to connect with transceiver" knows it comm 6 and confirm as device manager tells me the proflic driver set it to comm 6.
when I get the error the display lights up for a moment. that's it...

Mark,

You will also have to ensure that the COM port is identified when you download or upload to the radio. Mine showed COM1,3, and 5 on the cloning screen, COM5 turned out to be the one I needed. Your mileage may vary.

Good luck.

Bill, W4WNT

Welcome to the group. This topic has been discussed before.
See the thread hear:

http://groups.yahoo.com/group/baofeng_uv5r/message/19357

Read far enough in the thread and you will find the AA case, as
well as the AAA case have problems with this radio.
The voltage is too high to start with 6 cells so you need to
put in a shunt cell to bring the voltage down. After you have
used the radio for a few hours replace the dummy cell with the
regular alkaline cell you did not use. Even then you will not
get 100% of the available life out of alkaline cells only 75% or
so before the radio shuts down from low voltage.

Not a perfect solution but better than trying to look for a
current bush in an emergency.....

I have not tried using NiMh cells with the AA case. I suspect
you will only get 50% of the capacity due to their lower operating
voltage. You should not, however, have to use a dummy cell to
start.....

BTW 409Shop was fast and ordering was straight forward.

You need a battery shunt if you plan on using regular AA's instead of
rechargeables.

Jim,

I wonder if they (Baofeng) have enough room to fit (UV-5R All Mode from DC to Daylight, + TV Remote & Microwave Controller)? Maybe we could call it the UV-5R AMDCDL+TVMW for short?

If so, I'm thinking we should all get together, pool our resources to buy 500 or more, and set them up for sale at the local swapmeets (in everybody's local area around the country), right next to the guy selling HF Velocity Factor Grease (guaranteed to increase your signal by 2 S units or more towards that rare DX station on 20m). The follow on model would add cold-fusion as an unlimited power source, or perhaps a dime-sized solar panel glued on top of the duck antenna that would provide all-week power.

We could get the same guy that photo-shopped the UV-5R D-Star model last April Fool's day to make up our photos. What do you think?

Craig

What I can't understand is why Baofeng even makes a 6-cell battery case
if you have use a dummy cell to protect the radio from an over-voltage
situation when using alkalines.

Dumb.

Sorry , I Have been away from the hobby for a while. I should not have said most. With all the cheep import stuff they don't use good engineering practices . I should have said a good properly designed mobile or base antenna longer than 1/4 wavelength is at DC ground to prevent noise. You can find info in ARRL handbooks going back to the 50s if you are interested. Most Larsen,Maxrad... 5/8 wave antennas are tapped coils. I would not buy a mobile antenna longer than 1/4 wave that was not at DC ground.

They're probably expecting most people to use NiMH's instead.
Wouxun took the opposite approach, building their battery case to
hold only 5 cells, and as a result NiMH's are nearly useless with
that radio-- 6.0V rather than 7.2 is too little unless operating
receive-only. I would rather have the versatility of using
either, even if it means hassling with dummy cells.

A wider voltage tolerance would be ideal, but perhaps that's too
much to expect at this price point.

Make sure it's not a mistranslation...
Same 128 that appears in both Display A and Display B.
4 watts VHF + 4 watts UHF = 8 watts. :-)

I ordered the same 6-in1 set that Paul did. To my surprise, the one I
received works with the latest Prolific driver (YMMV). It is what I am
currently using on a daily basis. I still use the v3.2.0.0 driver to
maintain compatibility with the rest of my cables that have "prolific" type
USB-to-serial chips in them.

They are ALL IDENTICAL inside -- the only difference is the plastic case.

If you want absolute Part 90 compliance and want to be able to lock the radio into limited operation before handing it to someone else, choose the F-11

If you are concerned about accessories (especially about extended capacity batteries) buy a straight UV-5R for the widest availability of all the add on bits and pieces

If you are concerned about getting the very latest firmware version, you can deal with one of the few dealers who will tell you the firmware version they have in stock (Three Old Crows comes to mind). Otherwise it is just a gamble -- but it doesn't really matter because none of the firmware versions in recent months have really been different from the previous versions in any way that matters. You have a SLIGHTLY better chance of getting the newest firmware on a straight UV-5R rather than the other models simply because of the faster turnover.

If none of the above concern you, then just pick the radio you feel looks best -- the differences between models are entirely cosmetic except the F-11 which is really a straight UV-5R with factory modified firmware that lets you lock out the VFO/MR button

All good advice.

I will say this about Firmware... this should be the LEAST of your concerns about the radio. I have owned v.231, v.251, v.293, and now a v.297 (which is really v.311). They all operate well but the first one, the 231, which developed a mic jack problem. Probably from the many, many times I have experimented with programming, and plugging/unplugging into the mic/earphone socket.

But Firmware is just not a big deal as far as operating the radio.

If you are considering the AA battery holder, you really need to review the message archives to read about using a AA dummy shunt in the battery pack

From: Gary Udstrand

Can anyone recommend a AA battery holder for the UV-5R?

Thanks!

Make sure it's not a mistranslation...
Same 128 that appears in both Display A and Display B.
4 watts VHF + 4 watts UHF = 8 watts. :-)

32997. Travel Plus

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-26 23:08:18 UTC
From: ke8yn
Topic: 32997 Message: 32997

Greetings,
I'm trying to output the results from the ARRL Travelplus to CHIRP, but about half of the entries result in errors in translation. The reason I'm using Travelplus is for trips, so I can plot the repeaters along my route.

I've looked in the files, but if there is already something posted, I didn't locate it.

Tnx & 73,
Steve

Steve,

I think Travelplus support was added to CHIRP quite some time ago. I don't believe that the CHIRP implementation has kept up with the Travelplus revisions over time and is mostly not functional. I believe that this is partially because the way Travelplus works is proprietary (no published specs) and would have to be reverse engineered. I there isn't one already, you might submit an "issue" on the CHIRP website.

One thing is different.
According to the picture, it takes antenna with an SMA-M,
not an SMA-F like the UV5R.

Things that make ya go Hmmm...

Or a crude system like a switch with a series of diodes to provide various voltage drops from fresh alkaline on through the discharge cycle. Easier than swapping a battery and would avoid having one battery with a different state of discharge.

I did resend it shortly afterward, so the last message should be fine. It does show up in the yahoo group site without any issues unlike the message before it. If it is not, this one isn't either and that means yahoo's groups is broken as I am adding these messages directly to the group using the built in yahoo text editor.

If this and the last one are free of HTML (I hope) that means there is some issue with the "more option" button on the yahoo text editor (the small square at the top right). I would suggest not using it with google chrome for anyone who is replying directly to the group via the yahoo groups website.

Considering most of the survival types on the internet rush to order a UV-5R that's .25 lower on one web site vs. another, order a $3.00 clone USB cable that 90% can't get to work correctly (but will spend hours trying to figure out why their latest USB driver says it won't work, so therefore their cable must be "bad"), I doubt they will see much business at $52.00 for a 8W radio, but then again considering how little most folks understand the real difference between 4-5 watts from a UV-5R and this one, maybe they are onto something after all.....

Hello All,

One should look at this 8 watt radio more closely. Just for the basics, 8 watts of output power means that the input power should be at least 16 watts if you figure that the final output stage (class C) is 60% plus 10% for the synthesizer, light etc, efficient. The difference between 5 watts and 8 watts is not even 3db. You might not even hear the difference. 16 watts divided by 7.4 volts is 2160 milli-amps at best. This is the load that will be presented to the standard battery which is rated at 1800 milli-amp hours. It's life should be very short using the radio on high power.

I think that Motorola learned about ht's that produce lots of power. Their MX-360S VHF synthesized model that came out in late1975 could output 6 watts of RF power which would give the user RF burns if his lips got close to or touched the grill while transmitting. Our fire department use to use these on UHF and sometimes the personal would complain that their hands would heat up after transmitting. This was caused by the RF burns that their hands were receiving. This radio for those who are not that old was 10.79 inches high not including the antenna, weighed in at 40.9 ounces and at 6 watts drew a whopping 2640 ma at 7.5 volts on transmit. The radio used the hand of the user to extend the ground plane. Personal use to use the radio as wheel chocks on the fire trucks.

An ideal antenna AND ground plane would be 19 inches on VHF and about 6.5 inches on UHF. Anything shorter unless it is loaded; which will introduce loss, will increase the reflected power back to the radio thus, decreasing ones overall power output. Unless one is operating a lot of simplex, 8 watts might not be ones best interests.

Any comments, changes or deletions?

Hi Jim,

I really appreciate the info. I tried with an OPC 478 (actually a USB equivalent) connected to my PC. As the manual stated, I powered the radio down and then plugged the OPC-478 into the USB, then using that combo of keys, the radio came up in “CLONE” mode per the display message. I checked the control panel of my PC and verified I had the right COM port was opened by my cable.

I then tried both CHIRP and the RS-91 software, and got an error for both. The software appears to be finding the valid COM port, and it is able to open the port, but no communication with radio. It looks like from the manual that once you hit PTT, it simply dumps the memory to the other, slave radio, and does not have an opportunity for handshaking of any kind.

Great idea, but somehow can’t seem to get communication

The only thing I can think of is that perhaps the COM port property settings on my PC need to be something other than 9600 baud.

(and yeah, I do realize this is a Baofang group, I seem to be getting more help here than the ICOM group, thanks, you guys are great..!!!)

Michael

Mike K3MH,

The OPC-478 is the correct cable for programming your IC-91. The cables mentioned by others are either for a different purpose (control & data comm) or for a different radio (IC-51).

However, you must put the IC-91 into "clone" mode before you tell CHIRP to start sending the programming info to the radio. The procedure is shown on page 117 of your IC-91 manual (While pushing [MR] and [MEN/LOCK], push and hold [PWR] for 1 sec. to enter cloning mode). If this isn't done, the radio won't accept the programming info.

I have used several different computers with XP and Win7 and found this procedure to work best for a 99% success rate. Squeeze the cable while connected to radio but careful not to key it up during the transfer.

For best results after your driver is loaded, connect the cable to computer and make sure radio is off. Connect cable to radio. Load up chirp and choose radio model. Turn on radio. Get data from radio. Save data file. Make changes and save again with new name. upload to radio. Most of the time when it won't work, the cable is not seated into the radio tight enough.

If none of this works, check your driver. it is either not the correct driver or not properly installed. Check your device list and make sure there is a com port assigned to the cable while connected to the pc. A properly installed driver shows the com port for the driver in the device list. When the cable is removed, the com port assignment will go away. Make sure the com port in the device list matches in the software. Hope this helps.

This will also work with VIP but I don't use it. This works for me with chirp just about every time.

Michael,

Well, that's disappointing.

Sounds like either the OPC-478 or the IC-91 might be bad. Is there anyone local to you that might be able to check them using their radio and cable?

Just a thought.

73, Jim K5JG

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] Re: Blue Tooth UV 5RA? and wondering whats going on

We did some weekend Vegas tests with this unit running in simplex mode. My tests were 8 miles, 10 miles and 12 miles.

at 12 miles the contacts seemed scratchy but we were clear on VHF.

We did a max test at 18 miles on UHF clear desert using a Harvest HS −660 fully extended.

So that gives everyone some idea on the Simplex ability.

temp 90 degrees

day/night

vhf/uhf

LOS desert scrub, some mountains and valleys.

For the Blue tooth they have a Blue tooth setup using the Kenwood plug which costs more than the radio does. I might get one just to play with it.

The ideal answer would be a switch on the battery case to handle the two
battery chemistries. But that would probably confuse too many users as
well as adding cost to a product that sells entirely on price.

Second best answer would be to include one dummy battery with each case, but
that has the same problem as a switch - too many users wouldn't be able to
figure it out and it costs a few cents.

They're probably expecting most people to use NiMH's instead.
Wouxun took the opposite approach, building their battery case to
hold only 5 cells, and as a result NiMH's are nearly useless with
that radio-- 6.0V rather than 7.2 is too little unless operating
receive-only. I would rather have the versatility of using
either, even if it means hassling with dummy cells.

A wider voltage tolerance would be ideal, but perhaps that's too
much to expect at this price point.

Subject: Re: [baofeng_uv5r] Re: AA battery holder

What about using a DC to DC converter in the battery pack? The 6 x AA battery pack looks like it has some room in it. Can anyone tell me the current draw while transmitting.

nv7v2000 <nv7v@...> wrote:

Welcome to the group. This topic has been discussed before.
See the thread hear:

http://groups.yahoo.com/group/baofeng_uv5r/message/19357

Read far enough in the thread and you will find the AA case, as
well as the AAA case have problems with this radio.
The voltage is too high to start with 6 cells so you need to
put in a shunt cell to bring the voltage down. After you have
used the radio for a few hours replace the dummy cell with the
regular alkaline cell you did not use. Even then you will not
get 100% of the available life out of alkaline cells only 75% or
so before the radio shuts down from low voltage.

Not a perfect solution but better than trying to look for a
current bush in an emergency.....

I have not tried using NiMh cells with the AA case. I suspect
you will only get 50% of the capacity due to their lower operating
voltage. You should not, however, have to use a dummy cell to
start.....

BTW 409Shop was fast and ordering was straight forward.

From: milne_rob
Topic: 33026 Message: 33026

we picked up 2 Baofeng UV-5R tranceivers and after charging 1 works great (pre-programming) and the 2nd one is stuck in the screen display(page 10 of user manual with out numbers) before welcome message.

Has anyone had this issue? We thought it was in "lock" mode but no buttons will work.

The radio will not do anything and we are wondering if there is a series of buttons to "bypass" to get to welcome screen and so on.

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-27 17:32:42 UTC
From: Stephen Wandling
Topic: 33026 Message: 33027

I am also fairly new to this radio. On page 10 of my (numbered) manual I see a screen (1st frequency 434.325). On my radio this is what you see after the Welcome message.

The only button 'trick' I know of is to turn off the radio, hold the 3 button and turn it back on. It should give you the firmware version before showing either Frequency Mode or Channel Mode. Mine is BFB297.

If it does or does not do this, I am not really sure how to proceed. If you have CHIRP programming software and the driver for the USB programming cable installed, you can try to access the radio from CHIRP. Within CHIRP there are a number of settings you can access. It is recommended that the first time you access a radio with CHIRP you select 'Download from Radio' first. Full information on programming is on the Miklor site at the URL at the bottom of this email.

Hopefully someone else here can provide you with more assistance.

If you are referring to amateur radio repeaters, you can find out that information through many different sources, including the ARRL Repeater Book, apps like Repeater Book for your iPhone or Android phone, or just use Google or Bing to search.

33030. Re: Second (new) UV-5R doesn't work with Chirp?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-27 19:26:03 UTC
From: RichardS
Topic: 32711 Message: 33030

Afternoon, Gents .....

Returned from vacation yesterday, so back to work on the UV-5R problem.

I programmed a few channels in the new radio manually just to try it out. After the first couple of transmissions, the audio came on constantly with a sound I can only describe as a Yellowjacket getting an enema. Noting I could do seemed to cure it, so I'm am returning the radio to Amazon from whence it came. Two problems too many.

I'll just get another. Thanks all for the kind words of advice. My old radio continues to function normally with both of the programming cables I have (no mods needed), and one cannot download from a radio which refuses to communicate.

I didn't notice whether it was set on Group A or B when first trying it, but I was in frequency mode. I will pay attention to that in the future with the old radio and when I receive a replacement for the defective radio.

33032. Case alignment

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-27 20:10:29 UTC
From: <hamrad@...>
Topic: 33032 Message: 33032

I purchased one of these radios a few weeks ago and today I received a speaker/mic for it put could not get any audio out it. What I discovered is the two jacks on the side of the radio for the mic and speaker were offset and the plug from the speaker/mic would not seat all the away and therefore was not making contact. If I pushed on the connector real hard I could get it to make contact. Therefore, the connector will have to be trimmed to fit.

Question: Is due to a tolerance problem on the radio (holes offset) or the connectors on the speaker/mic which should have been offset. The speaker/mic is an MFJ-295K and is marked on the box "compatible with Kenwood".

Thanks for your time,

Tom

The longer one on the left is the newer design. At least that's the one that came with my UV5RPlus with BFB307.

It's my understanding (from Baofeng) that It's up to the buyers which antenna they get.

I would imagine you bought your radios from Amazon or such on the cheap?

Sounds like a bum radio to me. The power-on message (menu 38 (PONMSG) =
FULL in this case) should only display less than 2 seconds. I doubt that in
this state, you can 'talk' to it with a computer. If you can read from with
with CHIRP, you might try uploading the 'reset' image of the matching
firmware version to see if you can revive it. Otherwise, I would recommend
getting it replaced.

I'll also add that in my testing so far the "newer" design is worse than the original. Baofeng doesn't label their antennas

I get the impression all of Baofeng's antennas perform poorly..the 2 that I have both get outperformed by quite a bit by the Expert Power 669C

http://www.baofengradio.com/en/product.asp?BigClassName=Accessories <http://www.baofengradio.com/en/product.asp?BigClassName=Accessories&Smallclassname=Antenna> &Smallclassname=Antenna

They don't post any gain numbers.

I hope to have some comparative transmission tests on signal level in the next few days on several antennas.

I plan on testing signal S level on these:

Like Mike said, the one on the left is the better antenna from what I've read. It is the same as the one that came with my UV-B5. It is supposed to be better than the famous "$3.79 special" antenna and I just ordered one from an eBay seller in China for $4.98 shipped. Just search eBay with the keyword "Qriginal" (yes, that is a "cue" instead of an "oh").

It is Taiwan made

http://dx.com/p/rh-660s-10w-telescoping-vhf-uhf-sma-k-high-gain-antenna-for-walkie-talkies-black-169215

However, the next version up the 770S is more robust and gives another .5 db on uhf (5.5 db gain)

I have both, the drawback with the 770S is it is heavier compared to the 660 but more robust and can take more abuse.

it really kicks in Simplex mode and of course for hitting far repeaters.

I would not carry a telescopic around that will get abused , use the 771 for that. In tight situations or when you just need that little extra this kicks in really good.

Insure the packaging has both Chines (traditional) and JP characters with a hologram sticker on the base, those are the real ones and generally also have a price in NTD

New Taiwan Dollars. Fakes are cheaper lighter metal with light plastic on the base

expect to pay $20+ for a real one.

Subject: Re: [baofeng_uv5r] Re: Blue Tooth UV 5RA? and wondering whats going on

We did some weekend Vegas tests with this unit running in simplex mode. My tests were 8 miles, 10 miles and 12 miles.

at 12 miles the contacts seemed scratchy but we were clear on VHF.

We did a max test at 18 miles on UHF clear desert using a Harvest HS –660 fully extended.

So that gives everyone some idea on the Simplex ability.

temp 90 degrees

day/night

vhf/uhf

LOS desert scrub, some mountains and valleys.

For the Blue tooth they have a Blue tooth setup using the Kenwood plug which costs more than the radio does. I might get one just to play with it.

You can open the img file with MS Notepad (plain text). Right click on the img file, and choose "Open With", and specify Notepad. Scroll down the page. Near the bottom you will see the true version. Doing this, scrolling down to the bottom of my latest UV-5R, received last week, is this among the symbols:

I don't think this has been fixed. The FAQ that you quote above didn't
match my "Reference for UV-5R Menus" so I decided to test it on my radio.
Both the FAQ and my guide were in error.

For R-CTCSS tones of 131.8 Hz and lower, the receiver will not stop. For
R-CTCSS tones 141.3 and higher, scanning will stop no matter what CTCSS
tone the monitored station is sending.

I updated the "Reference for uV-5R Menus" accordingly.

I believe that it was BFB293 added a 3rd mode, "flashing", to the UV-5R flashlight. Then BFB295 changed the flash rate. I don't know that anyone has discovered any user noticeable changes caused by firmware updates since BFB295. An unofficial list of changes is kept on the Miklor.com website.

All odd numbered firmware versions after BFB297 have all been masquerading as BFB297 (VHF/UHF radios). All even numbered firmware versions after BFB298 have all been masquerading as BFB298 (VHF/220 radios).

There was a comment made earlier as to why Baofeng may have intentionally hid the "real' firmware version. The reason sounded plausible to me.

Thanks Jim,

Yes, it seems reasonable to not stampede the herd with even more confusion. Are you ever able to get a "what's been changed" list from Baofeng when firmware is introduced? There seems to be a few folks here that are connected in some way to China, so I'm thinking they might have some inside track on Baofeng info.

I'm at the end of one full week with this radio, and have gone through the frustration and elation that seems to be common, from what I'm hearing here. I'm thinking that if it works, and it does, and I can control/program it as I would like, which I can, then there's nothing left to do but enjoy it!

If we were informed as to what has been removed and/or added in each firmware issue, that might be of some value, but we're not. And I suspect that the changes are very small and possibly nothing more than housekeeping issues.

A big thank you to you guys for getting us going.

Hi at all,

in a Japan transceiver it's possible setting the light of display ONLY when a key it' pressed .

In uv5 : the light remain off, or on when trasmit or goes on every time a signal was received(very annoing function!)
Exist a command for setting LIGHT On ONLY if a keyboard it's activated oand light off on standby, receiver or trasmit?
Thanks

No it's not, the FM demodulation process is fully digital. You may refer to the KK6BWA's guide to hack the UV-5R by removing the CPU (and replace it with something else) and asking the radio chip to bypass the ouput filter.But there is no simple way to do this...

Mike,

although purchased at the same time , they came from different vendors. I ordered mine from 3 Old Crows and my friend ordered his from Amazon.

Although I am a new ham (got my ticket last week), and don't have any test equipment, my subjective testing suggests the same thing you said, which is that the "older" antenna works slightly better than the new one. I have also bought and tested the Smiley 270a and it seems to be worse than either stock antenna.......Soooo... I am looking forward to your "scientific" testing results!!!

I assume the radio you got is the one on the right? Seems some of the Amazon ones may be left-over parts put together from returns and such which would explain the cheap price. That's why I buy from a more reliable source like you did.

During my preliminary testing the Smiley 270a came apart and it also performed worse for me. So it's on my poop list right now. I can reassemble it for my next test run but it appears to be headed for the "bad antenna" pile in spite of the anecdotal "great antenna" I've seen. What I plan on doing is monitoring the S level on my ICOM IC-706MKIIG (I've got an attic Diamond X-30 antenna) via a webcam and head over to Starbucks and test the antennas.I may also record the audio which hopefully confirms the S-level results though some antennas may pick up more noise than others. Then take the best of that group and head out to the point where the S level is really low on the best antenna and test them again to see if any are better at that distance. So that will give me 2.15 miles at Starbucks and my antenna should be just above the ground height between them so should have reasonable line of sight. I also plan to test about 30-50 feet apart at my house with my attenuator to get relative measurement and see how that compares with the others. So 3 different distances is my goal. And I plan on using the radio hand-held speaking into the mic at 1-2" which is what it's designed to do while facing my house.

I’m not inclined to test many 1 meter long antennas….

But if you can give me a source that’s not EBay or Hong Kong I’ll consider getting them.

I’ve got two telescopics now so if either of those performs well it might be worth getting some others to test.

The problem with all these antennas is the best they show is theoretical numbers and theory and mother nature are two different beasts.

Topic: 32784 Message: 33081

Taking Jerry's (K7OQV) suggestion, I ordered the Baofeng cable from Amazon:

http://www.amazon.com/gp/product/B00CP0I474/ref=oh_details_o00_s00_i01?ie=UTF8&psc=1

It showed up last night, but I didn't have a chance to test it since I was out doing something frivolous like taking my general exam (which I passed). :-)

I tested it buy just plugging it into the Mac and it didn't jump into transmit mode which is good. I had to down load the Prolific PL2303_Serial_USB_on_OSX_Lion driver. Once I did that, Chirp recognized the radio and I was able to download the contents.

All is now good.

Thanks for all of the help!

Leo - KC3AZL\AG

Sounds like the one radio is DOA. Can you contact the seller about a replacement? There are some things that can sometimes fix some strange behavior of these radios, but it seems highly unlikely that they will work in this case. I would try removing the battery for a while then reinstall the battery and try it again. but since the radio is newly purchased I would strongly recommend immediately contacting the seller about getting a replacement.

Subject: [baofeng_uv5r] New out of the box Baofeng UV-5R Questions

we picked up 2 Baofeng UV-5R tranceivers and after charging 1 works great (pre-programming) and the 2nd one is stuck in the screen display(page 10 of user manual with out numbers) before welcome message.

Has anyone had this issue? We thought it was in "lock" mode but no buttons will work.

The radio will not do anything and we are wondering if there is a series of buttons to "bypass" to get to welcome screen and so on.

Hi Daniel:

Welcome to Ham Radio!

None of us were born knowing anything about Amateur Radio. We all learned something, some a little, some a lot -- and most of us have had a lot of fun in the hobby.

Join a local Ham Radio club. Try to hook up with an elmer (tutor or mentor) who can explain a lot. Join the ARRL. You'll receive QST magazine every month. Depending on your background, some of the articles might be over your head. But some will not, and you'll understand more and more as you go along. Work on upgrading your license (you'll find some great tips for passing your test on my Web Site). Spend a lot of time listening. If you have a Baofeng UV-5R, most of the information you need is at www.miklor.com. Do some homework there and you'll find answers to almost all of your questions.

Attend a local Hamfest. There's one in Findlay, Ohio (about 2 hrs from you) next Sunday, September 8th. You think you're overwhelmed now? Wait until you see all the wonderful stuff on display there!

Ignore the trolls, belittlers, bullies, and idiots. They are not real Hams. You, on the other hand, ARE a real ham and you now have a license to learn.

There are at least 30 different kinds of Ham Radio, and there's something there for everyone. Pick an area or two, or three, that interest you, and explore them.

Most of all, have fun with Ham Radio. Sooner than you think, you'll be the one giving advice to the newbies!

Hi, new to the group - I have 2 fresh out of the box UV-5R transceivers. One has the up/down arrow symbol in the display to differentiate between vfo a/b or menu choices etc. The other did....until I did a reset trying to clear factory memories and started pushing buttons like a boss. Sigh, ignorance is bliss. I've searched for an hour for any mention of other people having and correcting this and have found nothing. Does anyone know how to get the arrow back so I can tell which vfo or menu choice etc. is active?

Thanks

> I doubt that "pushing buttons like a boss" caused the 'cursor' arrows to disappear. It is more likely a bad display or poor assembly of the cable from the circuitboard to the display. But just in case button pushing could have messed up your radio in some way, install the latest daily build of CHIRP. Download from your radio to get the memories and settings in CHIRP. Look on the Settings -> Other Settings menu for your firmware version. Then go to the following location to download the 'reset' file that matches your firmware version.

http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/

Upload the 'reset' file to your radio. If it was a memory glitch in the radio, it should be fixed. If it isn't fixed, it is probably a hardware issue that is just coincidental to the button pushing.

Thanks Jim, I watched the display test during power up on both and the up/down cursor arrows are only present on the unaffected radio. All other display elements are common to both radios. So, that would lend credence to the hardware/cable suggestion. I will look into getting a cable for the CHIRP recovery.

I'm almost certain that someone had a similar issue 6 months to a year ago and described in detail how to disassemble the radio and make repairs. Unfortunately, Yahoo! Groups is going through an evolution and I'm not sure if I can search and find the reference for you.

You might also look through the group files area. I believe that there are dis-assembly pictures there.

But since the radio is new, you might be more interested in getting it replaced.

Good luck with it. Let us know how it goes.

Jim KC9HI

33094. Latest build of CHIRP

From: Erik
Topic: 33094 Message: 33094

G'day

Just thought I'd point out somethin new with the latest daily build of CHIRP that I've noticed.

Seems that with my UV5R Plus I can now upload image files to the radio with the antenna connected and receiving a signal no problems.

Anyone else notice this?

Erik

Yes, yes...I'm new lol Before you say it I will do lots of
reading. I have a bad habit of putting the cart before the horse.

I bought 2 " BaoFeng UV-5RE Plus UV 5R+ Dual-Band 136-174/400-480 MHz FM Ham Two-way Radio, Improved Stronger Case, More Rich and Enhanced Features", I have no idea what the "E" means lol Much less
anything else for that matter.

I am overwhelmed, but reading more of what you all post in time
I'm sure I'll be ok. I have not 'met' my UV-5RE's yet.
I'm out of state and they arrived at home in Fl. (near Pensacola)

I met a new friend and her husband showed me his "Ham room" after
I mentioned I bought a book "Ham for dummies". He talked
so fast and long I couldn't keep up. I never read the book yet, I left there thinking I'll never learn everything he just went thru with me.
So, I'm back and interested and maybe the Group here is the pace I need.

I wonder if I should have ordered the UV-5r without the "E" lol

I bought these to learn, plus have fun camping with and I live in a hurricane area. Other then Sprint starting to work for cell service
Ham operators were a huge help after Ivan in my area.

I'll go back to lurking and reading unless I just get stuck once I get home and meet up with the UV-5RE's.

Thank you
B

33096. 500 mW ERP

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-29 11:05:10 UTC
From: kd0ucr
Topic: 33096 Message: 33096

In order to use the Baofeng on the FRS (Family Radio Service) frequencies, I'd need to reduce ERP to 500 mW or less. The low setting is 1 watt. I don't know how lossy the stock antenna is -- could it be -3dB? Is there any other way to lower power to 500 mW or less?

Basically, it would be convenient to be able to call my son home for supper using my HT, or be called by him in an emergency on his walkie talkie, since the HT is almost always on me anyway. And, if I don't have to buy the GMRS license to do it, that would be great!

There is one other, no two other issues involved.

First the antenna must not be removable, swappable.

Second, the radio is not type accepted for that service.

On the other side, I doubt that the FRS police are going to come knocking on your door.

The choice is yours.

The honorable one would be to get him to go for a Tech license, the learning curve is not that steep, then you both gain something.

Stan

HI,
The tech license is not that hard to pass,depending on how well you can learn and study on your own,I studied a study guide and took practice exams from the current question pool for about a month and passed the exam on the first try.One thing to note is the question pool is going to be changing June 30,2014 so you may want t o take the exam before then.

Ah! Thanks, great points. For some reason, I had it in my head that this little radio could be used in frs , nuts and gmrs, probably because they come up in those Amazon searches! guess I hasn't given it much more thought beyond "boy, that would be convenient!"

He's young for a tech yet, I'll just pick up a few more cheap frs radios for now.

Thanks!

I have purchased several Beofeng radios for our Community Emergency Response Team. Advisers called called us foolish and recommended $1000 HT radios instead. Our entire radio budget was less then that. We used this forum to find the software and tips we needed to set up our UV5R and UV3 radios and our repeater for GMRS. Everything has worked GREAT!. When the doubters heard us on the net they refused to believe they were beofeng radios.

Thank you.

OMG is it nice.:-). Programmed in a local repeater without bothering to read the manual. The menus look pretty self explanatory. Sure I'll need do do some reading but for the basics its real nice. :-)

I'm looking to pass the general exam and I want to take it soon. What online material would you recommend for reading. I have practice exams. I just want something to read to get up to speed on rules regs and freq ranges. The tech exam is a breeze but the general I need to improve a little.

FYI I studied for a ham licence when I was a kid but never got around to getting a licence. I have a background in electronics and have always been into shortwave listening so I just need the info I'll need for the general exam. I would rather read and retain than memorize test questions. Right now I might pass the general but I don't want to take the exam to find out. What study material do you all suggest.

Also I'll be learning Morse code. Any code training tips. I believe the Farnsworth method teaches at a higher speed so you hear the patterns instead of dits and dahs. I suppose there are apps for my smartphone.:-)

Kevin,

I get a bit tired with some of the 'holier than thou' responses here. "Will the person who has never exceeded the speed limit please put up their hand?"

I am a fan of observing the "intention" of the law, even when I can't quite satisfy the letter of the law. And when it comes to issues of safety and the well being of children, I am prepared to bend things a bit further.

If I were in your shoes, I would program an FRS channel with Low power and Narrow band transmission. You will be 3 dB over the law and your modulation bandwidth would comply. The 'no removable antenna', like the .5 Watt limit, is intended to thwart what happened with CB radio: guys with linear amps feeding 10M beams.

Anyway, that's my $0.02 worth.

Hello B,
Welcome and good luck with your ham studies. As you have seen, there is lots to learn and lots to do in ham radio. Focus on passing the Tech test. This is a lower hurdle than learning everything you'll find in the various Tech license manuals.

Bill, W4WNT

Sure I speed at times. I know its illegal and if I get caught, I can be fined. Most purchasers of this radio have no clue its illegal to use this radio here in the USA on GMRS/FRS/MURS bands. When I pop in and inform, they can no longer say they didn't know. Then it's up to them to do the right thing, or wrong thing if they don't care. However remember some of us tried to educate them when they start showing up on the ham bands you enjoy without a license and could care less they are now interfering on your bands, and sooner or later they will!

Topic: 33034 Message: 33117

Best antenna comparison (for the search engine).

I did a quick test today at 2.15 miles to see if my setup works OK.

Not exactly line of sight but I'd say the curvature wasn't a whole lot from test to shack.

ICOM MK706MKIIG with Diamond X-30 attic antenna at approx 22ft AGL, 700ft ASL. I had squelch on S2 so I'm going to drop that a bit to hopefully let the stubbies work since 2 of them were squelched completely.

UV-5R at ~5ft AGL (I'm 6'1"), 640ft ASL handheld in front of face, antenna vertical, with mic approx 2 inches from mouth, facing shack.

Only did 146Mhz VHF as I have to take a trip home to switch to UHF. I've also got some more antennas coming.

There were 20-40 seconds between each test.

Here's the video I recorded and edited to remove some of the silence in between tests.

https://www.dropbox.com/s/z6e1kalniflqf1x/AntennaTesting20130829.wmv

I've ordered the results below from best to worst.

You'll notice a general pattern….half wave, 15" group, stubbies…pretty much what the theory says so is a bit satisfying to see.

I didn't try the MFJ-1714S with a segments extended to ¼ wave (I was in a bit of a rush) but will do that on my full test. I did try it full retracted and it wouldn't break squelch that way.

I've got some more antennas coming to add to the pile. And I may try some duct tape on the Smiley so I can at least test it.

I'll also have to get a scope and see if I can semi-calibrate the S-meter on my ICOM to better find out what the levels mean.

Since Baofeng doesn't label their antennas I put the radio model that the antenna came with for what it's worth. The UV-F9 looks like the "newer" one people talk about and it did worse than the UV-5R stock antenna. Also what's interesting is that the original stubby has a black label around the connector which says "FM.136-174/400-480MHz" and the "newer" stubby has a red label which says "UHF:400-480MHz" and I can't find the newer one on their website at all. That antenna came with my UV-F9.

Here's a picture of the two Baofeng antennas

https://www.dropbox.com/s/mmofkcufgl78k78/BaofengAntennas.jpg

Lengths are total lengths from base to tip.

It is bad enough using a radio when it is not type accepted or certified for the band (murs, frs), but it seems to be worse using it when the users also need to be licensed. Either get the CERT team licensed on their own public safety freqs or get ham licenses. Cheaper and more versatile than GMRS licenses. Individuals may be able to sneak by with it easier than an organized group.

OMG is it nice.:-). Programmed in a local repeater without bothering to read the manual. The menus look pretty self explanatory. Sure I'll need do do some reading but for the basics its real nice. :-)

I'm looking to pass the general exam and I want to take it soon. What online material would you recommend for reading. I have practice exams. I just want something to read to get up to speed on rules regs and freq ranges. The tech exam is a breeze but the general I need to improve a little.

FYI I studied for a ham licence when I was a kid but never got around to getting a licence. I have a background in electronics and have always been into shortwave listening so I just need the info I'll need for the general exam. I would rather read and retain than memorize test questions. Right now I might pass the general but I don't want to take the exam to find out. What study material do you all suggest.

Also I'll be learning Morse code. Any code training tips. I believe the Farnsworth method teaches at a higher speed so you hear the patterns instead of dits and dahs. I suppose there are apps for my smartphone.:-)

Hi, Jardy,

It depends on their location, as well. Around here, a lot of the large farms use Marine radios. It's doubtful that they'll interfere with ship traffic in North Dakota. One Radio Shack employee reported one outfit when they bought a bunch of them and the FCC sent the owner a letter that if it received any complaints of interference, his equipment would be confiscated and he'd be subject to a fine. I guess he was really shaking in his boots.....NOT! Oh well.

Dave, you DO know that these radios are illegal to use on GMRS unless you have a GMRS license. Any other bands (2Meter, 70 CM) you need to have an amateur radio license.

You can take the general exam right after the tech exam for no extra charge…then take the extra too if you want.

As long as it’s the same test session they don’t charge for taking another test. Many people take the next exam just to see the questions and how they do on them.

Much better to take the radio along too – so that you can try screwing in the replacement screw BY HAND (no screwdriver!)

Metric screws come in even more sizes than the common US (SAE) sizes and are very hard to judge by eye. A slight difference in thread pitch can be the difference between a screw that fits properly and one that will strip out the threads.

From: Craig Carnahan
Take the remaining screw to any Ace Hardware, True Value, Home Depot or Lowe's and you should easily be able to find a match.

Just make sure he doesn't have access to a radio.

One simple way to make the UV-5R operate at 500mw is to modify the antenna
to operate at 3 db loss.

33130. Hypocrisy

Richard,
Hope I have seen this a couple of months back...these links help me for the mac config as well. Installed it on my MBP 10.8.4.
http://www.xbsd.nl/pub/osx-pl2303.kext_1084.tgz
http://www.xbsd.nl/2011/07/pl2303-serial-usb-on-osx-lion.html

First - read the discussion/instruction first on chirp website and links provided before doing any install as you might need to modify some cmd on serial port driver install. Some older sw version of mac before 10.8 might need a different pl2303 serial driver package. Install chirp, install KK7DS_Python_Runtime_R10.pkg, run the instructions on http://changux.co/osx-installer-to-pl2303-serial-usb-on-osx-lio/ paying close attention to the kextstat -b cmd results. Then voila.. no reboot needed! Works flawless for me ever since without horror story that I read on a lot of post on our pc side cousins gee - because I went thru the same ringer despite the fact that i'm a mac newbie and mostly using pc i find it less painful and easy.

There is a new cable release by baofeng now that supports windows 64 bit in amazon hopefully to alleviate serial port driver issue.

Second, any future mac installer please do a step-step install document since this is what i forgot to do. It will be nice for someone who will stumble upon this threads and can point them to that less painful direction.

This is my very first post on this group and its a very useful resource indeed..

Tail your syslog. Plug in your cable. The syslog will announce what the chip says it is when you plug in your cable. Search for that string in Google, there are a couple people that have replaced their Apple driver with one that works for that chip.

No one should have to use Windows, life is too short! You could also use a Linux VM or bootcamp wiht Linux - default driver works great.

And that is because they do not have Part 95 certification. However, there are very few non "bubble pack" radios that do have that. You would have difficulty finding a Part 95 certificated 50 watt mobile or repeater (both of which GMRS permits). So what tends to happen is the "high end" or "serious" GMRS user tends to use Part 90 certificated equipment for mobile and repeater purposes. At the present time, the FCC does not seem to be too concerned about this particular detail, but if they chose to, they could certainly enforce it.

It seems in general, the feeling is using Part 90 certificated equipment for GMRS is "acceptable" (agreed, not legal). But this also tends to assume the person setting up/programming the radio knows what they are doing and I can't say that is the case with the average Baofeng user.

Part of helping each other is to help people follow the rules that might not otherwise know or think about them. If they do get caught, they couldn't say "I didn't know!!" To properly use these radios or the Wouxuns, you either need to be ham licensed or licensed on business or public safety freqs, or authorized by someone who is (fire dept, etc). Just because a gun CAN kill someone doesn't mean it is legally ok to. Special circumstances apply to both.

Erik,

The latest two daily builds do not have changes in the UV-5R driver. There aren't even any change that would affect Baofeng radios. You would have to downgrade all the way back to the CHRIP daily-20130503 build to have a change noticeable by someone with one of the traditional UV-5R{something} family of radios (the firmware version would no longer be displayed in the Other Settings menu).

The last 5 changes submitted for the UV-5R driver were...

8/17/2013 add support for a new Baofeng UV-82 firmware version
7/13/2013 add a setting specific to the Baofeng F-11 radio
7/9/2013 add support for the new Baofeng UV-82 radio
7/3/2013 add support for the Baofeng UV-5R VHF/220 radio models
5/4/2013 add support to display the firmware version (affects all models using UV-5R driver)

None of them affect the way the UV-5R driver 'talks' to the UV-5R.

Unless you have a UV-5R with the 220 band, the F-11 or the UV-82, there is no need to install a build newer than CHIRP daily-20130505 because no changes have been made to the driver that would affect how CHIRP communicates or otherwise works with your radio.

Exactly where did I state we do not have proper licensing? Our GMRS and Repeater are licensed. We use channel 15 on the GMRS FRS band where that is allowed. We also have 2 meter and 440 repeaters. Since many of our folks only have FRS we use them to keep them part of the operation. We only use the radios to train with EMS or on actual Disasters or Fires we are well within the letter of the law.... Sorry to get all your panties in a bunch.

I did say "few", not "none". Many manufacturers have not submitted for Part 95 certification, Kenwood in this case did (which is great). I acknowledge there may be no technical difference between a radio that is Part 90 and Part 95 certificated (depending on the specific radio), only a paperwork difference.

I think the important point is knowing what equipment you have, and what it is authorized to be used for (and not used for).

(This also applies to ANY Yahoo Group.)

Go to the main page of the group at:

http://groups.yahoo.com/group/baofeng_uv5r/

and sign in.

After you are signed in, near the top, in blue, you will see "Edit Membership".

Scroll down to Step 2.

If you are receiving individual emails for each post on the group, it is quite irritating. You may opt to receive up to 25 emails as a "Daily Digest", which is one email.

Or you may opt to remain in the group, but read and post only on the web, not via email, by checking "Web Only". This will leave you with the ability to sign in, read, research, look at files and photos, and post.

If you still want to leave the group then scroll to the bottom where you will see a button in the lower right, "Leave the Group".

I think the important point is knowing what equipment you have, and what it is authorized to be used for (and not used for).

Paul,
Have you been to the Yahoo! Groups web pages lately? In the last couple of days, the format of my Yahoo! Groups web pages has completely been revamped. Here is the announcement on my Yahoo! Groups home page.

"Thank You !
Thank you for being a great customer.
We made changes to your Y! Groups experience. Take a quick tour."

I'm not thrilled with the new 'experience'. Maybe my opinion will change once I get used to it.

My point is, although someone should still be able to figure out what to do from your instructions, they don't quite mesh with the new Yahoo! Groups format.

'I'm not thrilled with the new 'experience'. Maybe my opinion will change once I get used to it."

Y !mail and Y! groups both work better with Firefox then with IE.
If anybody is using the unsecure IE you should use something else.
The only time malware ever got into my PC was when I was using IE.

Also, if you use the email unsubscribe option you must find the email
with the confirmation link and click THAT LINK to get out.

Yeah. I don't use IE either. I use Firefox with NoScript and Chrome with ScriptSafe. I have 6 tabs open in Firefox with the Y! groups that I regularly monitor. They used to show the group name on each tap so it was easy to switch between the groups. Those are gone. I sure hope that is only temporary.

Yeah I know there is no code. Still want to learn it. If you know code you can work the world with an old tube from a TV. OK a really old TV. ;-) lol I'm surprised you can still get new tubes. So far my old Hallicrafters Super Defiant doesn't need tubes. I'll check out the link.
Thanks :-)

If you only obey law you will forget about morality. Just because some fallible men made a law does not mean it is right or absolute.

There is the stated intent of a law and sometimes its true purpose is something different. In this case I believe we are not talking about law, instead regulations which only have the force of law. Who elected anyone at the FCC? Congress unconstitutionally conferred some of its power to an unelected bureaucracy. Then that agency came up with regulations. Probably good but maybe overkill in some respects. But hey "one size fits all" is always good... right?

I'm with Stephen do it with respect and know its possible the FRS police might get you. So might the boogie man for that matter. Unless of course you abuse things but your not going to do that. :-)

I agree with everything you say but for one. Do right or wrong. For one it is not a law. It is a regulation from an unconstitutional source. Yeah I know the constitution been and currently being used for toilet paper.

If I use equipment the bureaucrats in Washington decided can only be used on said band on another is it bad or wrong? If it complies with signal strength, bandwidth etc who is harmed. No one. Is it possible someone will abuse things? Sure, the abuser will anyway and the persons going against a regulation but within parameters will have no effect. Still one should know they are doing something not sanctioned by our lords and masters.

As you can tell I am law abiding while having little respect for the lawmakers and especially the bureaucrats spewing thousand upon thousand of regulations every year. So many regulations even the bureaucrats have no idea what they all are. Did you know everyone commits on average two felonies a day with out even knowing it.

>Sure I speed at times. I know its illegal and if I get caught, I can be fined. Most purchasers of this radio have no clue its illegal to use this radio here in the USA on GMRS/FRS/MURS bands. When I pop in and inform, they can no longer say they didn't know. Then it's up to them to do the right thing, or wrong thing if they don't care. However remember some of us tried to educate them when they start showing up on the ham bands you enjoy without a license and could care less they are now interfering on your bands, and sooner or later they will!

Interesting when I look you up in the FCC ULS, I find nothing listed but a Commercial Operators license. So if indeed your using this radio your probably using it with your personal version of the rules.

If you only obey law you will forget about morality. Just because some fallible men made a law does not mean it is right or absolute.
There is the stated intent of a law and sometimes its true purpose is something different. In this case I believe we are not talking about law, instead regulations which only have the force of law. Who elected anyone at the FCC? Congress unconstitutionally conferred some of its power to an unelected bureaucracy. Then that agency came up with regulations. Probably good but maybe overkill in some respects. But hey "one size fits all" is always good... right?
I'm with Stephen do it with respect and know its possible the FRS police might get you. So might the boogie man for that matter. Unless of course you abuse things but your not going to do that. :-)

Yes that is my understanding as well. I think its $15 and you can take as many tests in one sitting til you fail one.

I use the Baofeng software for the initial program, then use CHIRP to pull it down, maintain the formatting in CHIRP, make any additions or changes, then use CHIRP to push it back up to the radio.

Really, you just need to program one line using the Baofeng software, then CHIRP seemed to grab all of the formatting from that line for each additional line.

Please folks--BEGGIN' ya here. I am at complete wit's end with this handheld and ready to take a sledge hammer to it.

Baofeng UV5R, Prolific Driver, BFB297 (bought last week off Amazon)

I have CHIRP, CHIRP finally acknowledges the radio and vice versa, programmed in the first 15 or so memory channels--uploaded to radio....the little green light on the radio seems to take the upload

Here is where the insanity beyond insanity begins.....

When I do what the folks on all these FAQ and manual sites say (menu - 2-7-menu)it comes up memory channel usually 001--NONE--NOTTA of what I have programmed through CHIRP come up--as if it never happened. I cannot find ANY of the channels I programmed with CHIRP--even to simply listen to a local repeater--and I cannot get the frequency dial to spit out anything other than 250 khZ which is basically worthless steps--why won't the radio accept straightforward keyed in frequencies instead of changing it?

I know it sounds a bit CRAZY, but is it asking too much to have someplace, any place, anywhere, where there is a STEP-BY-STEP way to get the radio going as a step-by- step LIST of what to do and how to do it straight out of the box instead of having that information spread out all over creation on different web pages?

i thought this sort of stuff had been disallowed in this group when you wanna-be pro-regulation-knowledge idiots wore out your welcome and i left a couple of years ago because of the overwhelming noise-to-signal ratio.

if you really think it your job to educate people we got plenty of home-schooled redneck fundamentalists anti-science creationists you can thump on all day long without trashing up this technical group. be happy to introduce you--you're a match made in .... er, heaven? [g]

and we hams have managed to police our bands quite nicely. proof is that we forced all the chicken banders (ex kir2686 here, although i was a ham before that nationwide fad hit) to get licenses if they wanted to join us. your worry about the invasion of our bands is as misguided as your preaching and as unwelcome.

How about instead of preaching to the choir each time,
an email can be sent to the "offender" directly instead?

33165. Waterproofing using NeverWet

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-30 03:31:45 UTC
From: <kd5yqv@...>
Topic: 33165 Message: 33165

Yeah, It's probably not the best financial decsion to buy a 20 dollar water proofing system to treat a 30 dollar radio. I might as well buy a spare radio, I know.

I've been pretty eager to test out the NeverWet super hydrophillic spray by Rustoleum on electronics and I have a UV-5R that I have disassembled down to the circuit board. It's definitely cheaper than testing it out on a smart phone or the like, and it would be pretty cool to have a waterproof radio - although testing the waterproof-ness of the radio is pretty much a "it worked" or "your an idiot who just wasted 50 bucks" situation.

While I've got the radio apart, and before i put the Rustoleum chemicals on it (who knows what *that* smoke would do to you when heated with a soldering iron), I am going to do the modulation mod from http://www.gorhudson.com/gor/baofeng-uv-5r-modulation-fix/ N5GOR has some pretty good details and sketches about what to do.

So, has anybody else done this, or should I post a bunch of pictures and results?

Greetings all. I appreciate sharing rule to try to keep others out of trouble. I just purchased a uv5r and joined the group. I am hoping to run across some interesting discussions soon.

Speaking of rules one thing I read in the group guidelines was advice to avoid was discussions of the "legal" use of the radio. I am not a moderator so that is all I will say on that matter as I don't want to add to the banter.

Thanks for reading and I look forward to sharing info on the uv5r as I gain some experience.

just try resetting the radio with the manual screen then try to program. resetting should erase all the test frequencies they put in them

goto arrl.org and order any level of book you wish. they are reasonabley priced and contain all the information you are asking for and a CD with the same and the test questions

Yes that is my understanding as well. I think its $15 and you can take as many tests in one sitting til you fail one.

yesterday

OMG is it nice.:-). Programmed in a local repeater without bothering to
read the manual. The menus look pretty self explanatory. Sure I'll need do do
some reading but for the basics its real nice. :-)

I'm looking to pass the general exam and I want to take it soon. What
online material would you recommend for reading. I have practice exams. I just
want something to read to get up to speed on rules regs and freq ranges. The
tech exam is a breeze but the general I need to improve a little.

FYI I studied for a ham licence when I was a kid but never got around to
getting a licence. I have a background in electronics and have always been
into shortwave listening so I just need the info I'll need for the general
exam. I would rather read and retain than memorize test questions. Right now I
might pass the general but I don't want to take the exam to find out. What
study material do you all suggest.

Also I'll be learning Morse code. Any code training tips. I believe the
Farnsworth method teaches at a higher speed so you hear the patterns instead

of dits and dahs. I suppose there are apps for my smartphone.:-)

Why pay for info I can find online. Plus I don't want to waste time waiting for a book to arrive. I already have books... except they are from the 70's. :-). I merely want the easiest/best online source. I really just need to brush up on rules/regs and frequency ranges as I'm sure there have been a few changes since then. Lol. As far as electronics I have that in spades. Rebuilt my Hllicrafters Super Defiant many years back and it still works. ;-). What I might do is vet a book for the extra class but that will require studying. :-)

Hi Gary, should I start shaking when I see you coming down Oak St with a directional loop spinning on top of your FCC van? lol Seriously has anyone here suggested doing something that would interfere with or disrupt communications? That fact you can look someone up is also a bit troubling for any privacy nuts. Although not sure how nuts one is if they value privacy. Maybe I'm the nut for being in databases. Now we have an out of control govt that is taking private databases and nationalizing them to collect info on the citizens for, well just in case. We are living in interesting times my friends.

Oh I see you are using an Indianapolis P.O. box. Is that how you keep your home address out? Maybe I should do that. I assume its a good way to keep people from knowing you have valuable equipment in your home. Why advertise where its kept.

What bands are you on Gary? When I get my ham license I would love to see if I could connect. I understand the repeaters tunnel through the internet coming out places far away. I have some learning to do. Being an IT Network Specialist I have to constantly learn new things. I actually like learning. Maybe its why I feel young. ;-)

Most people are pretty decent and will surprise you. Anyone wanting to get a ham license is not a bubble pack pirate, not a blatant one anyway. Take care and stop worrying so much about other people. Unless those people are politicians or in govt, then worry a lot. :-)

Nice meeting you and all the rest on this list. You have a good group of people making up the list. :-)

> There is the stated intent of a law and sometimes its true purpose is something different. In this case I believe we are not talking about law, instead regulations which only have the force of law. Who elected anyone at the FCC? Congress unconstitutionally conferred some of its power to an unelected bureaucracy. Then that agency came up with regulations. Probably good but maybe overkill in some respects. But hey "one size fits all"

is always good... right?
> I'm with Stephen do it with respect and know its possible the FRS police might get you. So might the boogie man for that matter. Unless of course you abuse things but your not going to do that. :-)

Regarding testing, I am a VE. According to the testing regulations from ARRL, you may take as many tests at one sitting as you want, as time permits, but you are required to pay for each one. Take two tests, that will be $30.00.

Yes, that is correct and I've done that myself. The point being though is that I PASSED my Tech test first, then upon seeing that I had passed, the examiner asked if I wanted to take the General. either way ya gotta be a Tech even if you just passed the test 2 seconds ago or a year ago.

Thanks I'll be checking them out over the weekend. In a book you can get to the nitty gritty pretty fast. The few online sources seemed difficult. Maybe the navigation of the sites I visited was poor. In any case I'll be brushing up over the next couple weeks. Ill have to travel a ways to find a place giving the exams.

P.S. why do they need your SS number? Do you just have to know your SS number or do they want to see the card. You know the SS card they said would never ever be used for ID purposes.

Thanks

Can anyone confirm what James said. I thought I read that it was $15 per time and not test. That you could take as many as you could pass in one sitting for one $15 payment. I probably read that wrong but my inquiring mind just gots to know... was it 5 bullets or was it six? ;-)

Topic: 33181 Message: 33181
Attachments: 1 described; binary payloads are missing from this source WARC

Hey gang!

It's been a while since I ordered my 220 MHz UV-5. I've been very ill and in pain for quite sometime. I actually received my new "http://www.radio-mart.net/Baofeng-UV-5RCX-Dual-Band-Transceiver.html" a couple of weeks ago but, didn't seem to care. I'm still messed up with my foot repair and extreme pain. So much so that, I could have cared less about looking at it yesterday.
...it's gotta be the Percocet...!

This morning I am still on the pain reliever but my mind is much clearer. I am heading back to my sisters' home today for our annual Labor Day festivities and cookout, and will bring the UV-5RCX 220/144 MHz walkie home, this evening.

I hope to have some basic information on this neat little radio, Monday!

Hope everyone has a Happy Labor Day

Tom G. AB1TR
...

~ It's a thankless job, but I've got a lot of Karma to burn off. ~

In the USofA there seems to be some procedural variation from one VEC group to another. Most allow testing for higher grades in one sitting for no extra fee. If you fail and wish to retake any level, there is another fee. Also per the FCC website you do not have to pass the tests in order, you are issued a certificate of completion for each test passed that is good for 365 days. However you may not transmit on any frequency until you have passed the Technician level exam AND are in the FCC database, then your privilages are based on the tests passed. You must pass Technician, General AND Extra to use Extra privilages. Most VE's however will not allow testing for a higher level until you hold a certificate or license for the prior level.

Subject: [baofeng_uv5r] Waterproofing using NeverWet

Yeah, It's probably not the best financial decsion to buy a 20 dollar water proofing system to treat a 30 dollar radio. I might as well buy a spare radio, I know.

I've been pretty eager to test out the NeverWet super hydrophillic spray by Rustoleum on electronics and I have a UV-5R that I have disassembled down to the circuit board. It's definitely cheaper than testing it out on a smart phone or the like, and it would be pretty cool to have a waterproof radio - although testing the waterproof-ness of the radio is pretty much a "it worked" or "your an idiot who just wasted 50 bucks" situation.

While I've got the radio apart, and before i put the Rustoleum chemicals on it (who knows what *that* smoke would do to you when heated with a soldering iron), I am going to do the modulation mod from http://www.gorhudson.com/gor/baofeng-uv-5r-modulation-fix/ N5GOR has some pretty good details and sketches about what to do.

So, has anybody else done this, or should I post a bunch of pictures and results?

Helping each other includes informing people about legalities as well
as the operation of radios. In the US the fines for illegal operation
can be as high as $10,000 per violation. God forbid you interfere
with Police, Fire or EMS. In some cases there can be jail time.

Not accurate. You must take and pass the Tech exam before you can be licensed. As someone else just noted it really does not matter what order you take the different elements in, but you can't be licensed until you pass Tech, and you can't get an Extra class without passing General. For that reason, most VE's do require taking them in order. Passing only the Extra exam does not give you credit for Tech and General. Passing only the General exam does not give you credit for Tech.

Hi, Harry,

Thank you! This IS getting tiresome. Every time someone asks about use on other frequencies or similar, the subject gets beaten to death, Fifty times over, until there's nothing left but dust. It happens in a lot of Ham Clubs that I have quit.

Why would one want to be a "Barracks Lawyer" is beyond me, as are many things. Hi.

73,

Bob

Rich,

Sorry, but your statement is absolutely NOT correct. It used to be that way many years ago, but no longer.

Now, an unlicensed person wanting to get a General class license must pass the Technician test BEFORE he can take the General exam. He can take them both at the same test session, but has to pass the Tech before they will administer the General.

Similarly, a Tech wanting to upgrade to Extra must pass the General exam first.

You cannot skip a step.

Well, I suppose many of us who are hams approach this from the "follow the law" perspective because in general, ham radio has successfully been self-policing since it started. This was built upon the fact that we were proud to be a member of this group and we wanted all of us to sustain a high standard in both operating practices and technical proficiency. Within the ham bands there are sub bands restricted to only certain classes of licenses. For the most part, hams even respect the operating privileges earned by their license and only operate in a sub band for which they are permitted. And here too, a ham license is "earned" as you have to pass a test and are not granted a license just for applying. That may be why some of us are quick to quote the law as an absolute.

That being said, I see the other side too. I have broken the speed limit. I have done home improvements without a building permit. I might have transmitted on frequencies for which I was not licensed.

I supposed it boils down to a few facts:

1 - The Baofeng radios are not type accepted for FRS, GMRS or Marine channels. It is illegal to use them for these purposes in the US.
2 - The FCC has more important things to do and is likely focusing no resources on this. Your chances of getting caught in the act are probably zero.
3 - If you do get caught you will have no ground to stand on. If you program a radio for a friend and they get caught, they will have a problem.
4 - The likelihood of getting caught increases if you build a large system such as a GMRS repeater with a hundred Baofeng users. The FCC may expend their resources for a big catch.
5 - The likelihood of getting caught increases if you have an adversary such as a competitor who knows you are doing this and turns you in.
6 - The likelihood of getting caught increases if you operate on an unauthorized frequency and the authorized folks complain of interference (regardless of type acceptance).
7 - There is the morality issue. The laws were supposed to be in place to protect the public interest. Often they are dumb laws but that's all we have. If you don't like the law you shouldn't promote public disobedience. Work to change the law within the system.
8 - There is the generally accepted practice that it is always a good idea to gain knowledge and understanding and then do the right thing. It is generally accepted that it is a good idea to help others grow and learn. Ham radio operators have tried to do this since the beginning of radio.

And finally.....
9 - Often people who are told they are doing something wrong don't like

it when someone else brings it to their attention. Not liking it does not change the wrongness so they discredit the messenger.

So in the end folks will do what they want anyway. If people are guided by a ham or a Land Mobile Radio professional they will receive better advice than if they are guided by someone who only has opinions.

Your mileage may vary.

33195. RE: [baofeng_uv5r] Baofang and Icom

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-30 13:20:43 UTC
From: Michael Hatzakis Jr
Topic: 32939 Message: 33195

Just as an update…. My objective was to use a USB cable to program my IC-91AD and use the same CHIRP program for both radios, ICOM and Baofang at the same time, and given the phasing out of COM ports, and, the ease of use of USB. I had an OPC-478, but would not work. In my main shack, I have a 16 port COM adapter to my hamshack PC because I literally have that many serial devices, from APRS, to three rotor controllers, to three CI-V rig controllers and four TNC's, a weather station, etc etc… and the serial to PCI-e card makes the wiring a mess behind my PC… way simpler to have a 16-20 port USB hub.

So, I did hand-wire the cable, it's really a snap, it's essentially three wires to the RXD, TXD and ground of the submini plug into the DATA jack. The headphone jack will only work in direct radio to radio connections. I watched the data stream and it does a dumb dump of data without any handshaking, so one cannot use that method for radio control, that I can see…

For building the serial cable, I used:
http://highfields-arc.co.uk/constructors/other/opc1529r.htm

And then I bought a handful of generic FTDI based serial to USB converters, see e-bay item number 151059801111 and just got it working great with my IC-91AD via USB and driver install was a snap.

I also ordered an OPC-1529 cable from the UK, the only place I could find a generic USB to OPC-1529 cable, E-bay item number 281094294898 and will let you all know if it works. I'm trying to clean up the hamshack.

Now I am able to swap programming banks of memories between the Baofang and IC-91AD in real time…. In case this is of any use to anyone on the list… I thought I would close out this discussion…

Michael,

Well, that's disappointing.

Sounds like either the OPC-478 or the IC-91 might be bad. Is there
anyone local to you that might be able to check them using their radio
and cable?

Just a thought.

RC modelers often waterproof servos and receiver boards with Corrosion-X

http://www.corrosionx.com/corrosionx.html

I treated the RX for a couple of seaplanes, and after a few *ahem* "hard landings" the electronics still work fine.

James,

You didn't say which organization you are affiliated with so your fees
may be different, but I found the following on the ARRL website:

"The ARRL VEC Exam Fee for 2013 is $15.00 (for one
attempt at all three license elements).

"If a candidate fails an element at an exam session
and wants to re-test for the same element, an
additional fee will be required."

This is from the W5YI website:

"Volunteer examiners are permitted to charge a fee to recover their
out-of-pocket costs in administering an examination. The current
examination fee is $14.00. Applicants may take as many examination
elements as they can successfully pass for the one fee. Another fee
is charged to retake a failed examination."

So, if you're an ARRL or W5YI VE, it sounds like you are over charging
your applicants who want to take multiple exams in one sitting.

73, Jim K5JG

James L Reeves wrote:
> Regarding testing, I am a VE. According to the testing regulations from ARRL, you may take as many tests at one sitting as you want, as time permits, but you are required to pay for each one. Take two tests, that will be $30.00.

Subject: [baofeng_uv5r] Re: Hypocrisy

Well, I suppose many of us who are hams approach this from the "follow
the law" perspective because in general, ham radio has successfully been
self-policing since it started. This was built upon the fact that we
were proud to be a member of this group and we wanted all of us to
sustain a high standard in both operating practices and technical
proficiency. Within the ham bands there are sub bands restricted to
only certain classes of licenses. For the most part, hams even respect
the operating privileges earned by their license and only operate in a
sub band for which they are permitted. And here too, a ham license is
"earned" as you have to pass a test and are not granted a license just
for applying. That may be why some of us are quick to quote the law as
an absolute.

That being said, I see the other side too. I have broken the speed
limit. I have done home improvements without a building permit. I
might have transmitted on frequencies for which I was not licensed.

I supposed it boils down to a few facts:

1 - The Baofeng radios are not type accepted for FRS, GMRS or Marine
channels. It is illegal to use them for these purposes in the US.
2 - The FCC has more important things to do and is likely focusing no
resources on this. Your chances of getting caught in the act are
probably zero.
3 - If you do get caught you will have no ground to stand on. If you
program a radio for a friend and they get caught, they will have a problem.
4 - The likelihood of getting caught increases if you build a large
system such as a GMRS repeater with a hundred Baofeng users. The FCC
may expend their resources for a big catch.
5 - The likelihood of getting caught increases if you have an adversary
such as a competitor who knows you are doing this and turns you in.
6 - The likelihood of getting caught increases if you operate on an
unauthorized frequency and the authorized folks complain of interference
(regardless of type acceptance).
7 - There is the morality issue. The laws were supposed to be in place

to protect the public interest. Often they are dumb laws but that's all we have. If you don't like the law you shouldn't promote public disobedience. Work to change the law within the system.
8 - There is the generally accepted practice that it is always a good idea to gain knowledge and understanding and then do the right thing. It is generally accepted that it is a good idea to help others grow and learn. Ham radio operators have tried to do this since the beginning of radio.

And finally.....
9 - Often people who are told they are doing something wrong don't like it when someone else brings it to their attention. Not liking it does not change the wrongness so they discredit the messenger.

So in the end folks will do what they want anyway. If people are guided by a ham or a Land Mobile Radio professional they will receive better advice than if they are guided by someone who only has opinions.

Your mileage may vary.

Also, yes, if you pass the Tech test, you may then take the General at the same exam session, and do so without paying an additional test fee. Should you pass the General, too, you may take the Extra at the same exam session for no additional fee. Anyone who passes the Tech should be offered to take the next test.

Also, anyone that schedules an exam with my team (I am a W5YI CVE)I highly encourage to study more than only the Tech. If you are smart enough to pass the Tech, you are smart enough to pass the General, too. At the very least, spend two additional evenings looking over the General material.

I have had people come in that ignored my suggestion, but passed the Tech. I then said, "OK, here's the General test." "But I didn't study that!" "Let's do it anyway."

One, a middle school English teacher, not someone who worked in a techy field, came within two questions of passing the General. Another came within 4. I asked afterwards, "If you had at least read over the material do you think you could have picked up a few more correct answers? If so, you likely would be a General right now."

Really guys and gals, do not shortchange yourself. And do not look at Tech as a stopping point. The General ticket is the most "bang for the buck."

Paul - AE5JU

I haven't looked at the extra class test. How would you rate the extra class test for a computer tech with electronics background building, repairing, creating. Would you say it would be hard, sort of hard, or just requires a brain. :-). I'm in my 50's so I went to school when they still taught you stuff.

I went back to college recently and I was amazed how stupid some people were. Down right scary. My wife's just finishing a culinary arts degree and half the people in her class still do not know basic measurements! Like how many ounces in a cup, stuff like that. I learned that in grade school. Lord love a duck my head going to explode. :-)

Also, yes, if you pass the Tech test, you may then take the General at the same exam session, and do so without paying an additional test fee. Should you pass the General, too, you may take the Extra at the same exam session for no additional fee. Anyone who passes the Tech should be offered to take the next test.

Also, anyone that schedules an exam with my team (I am a W5YI CVE)I highly encourage to study more than only the Tech. If you are smart enough to pass the Tech, you are smart enough to pass the General, too. At the very least, spend two additional evenings looking over the General material.

I have had people come in that ignored my suggestion, but passed the Tech. I then said, "OK, here's the General test." "But I didn't study that!" "Let's do it anyway."

One, a middle school English teacher, not someone who worked in a techy field, came within two questions of passing the General. Another came within 4. I asked afterwards, "If you had at least read over the material do you think you could have picked up a few more correct answers? If so, you likely would be a General right now."

Really guys and gals, do not shortchange yourself. And do not look at Tech as a stopping point. The General ticket is the most "bang for the buck."

I'm sorry to say the answer below is wrong.
If it was correct than why do you have to show prove of having an existing license before sitting for the upgrade?
When my club holds test sessions, once/month, you have to show a current tech license to take the general and so on. This is not our policy but the fcc's. Copies of you existing license and proof of id are forwarded to the local ve coordinator then on to the fcc.

33209. Books for sale

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

From: John Stewart
Topic: 33209 Message: 33209

My apologies if this isn't the proper place to offer these.
I have all 3 (Technician, General, & Extra class) of the Gordon West manuals for sale. These are the current editions and include the CDs. If you're thinking about taking the test, I highly recommend these. I studied these and took some online tests at eham and took all three tests at one sitting (and passed). They're great books, but they're just taking up shelf space here. For some reason, they're much more expensive than ordinary books; they cost over $20 a piece. Here's your chance to get licensed, or to move up, and save some money in the process:
Technician Class 2010-2014 $10General Class 2011-2015 $10Extra Class 2012-2016 $10
Add $2 for shipping, or buy all three and shipping is $5.

Once you pass the tech,you get a piece of paper stating such. That is all you need to take the next test for general. You do not need license in hand.

Jim K5JG,
You are correct. Volunteers from the Escondido Amateur Radio Society(EARS)give the tests at least once a month and only charge $5.00. I drove 50 miles to their session so that if I failed the extra exam I could take another shot without breaking the bank.

Normally I would because I'm frugal but I want to get my license so bad I can fasten it.
I'll look around but $15 is pretty reasonable.
Thanks

The ULTIMATE hypocrisy is any licensed amateur radio operator openly advocating illegal operation by any user in any radio service.

Much of the material on the Extra Class test is very specific, unlike the more general technical information involved on the general and tech class tests. For example there are questions about the details of conducting ham radio license testing as a Volunteer Examiner.

Regardless of your technical background, I would advise reviewing the practice tests available online and/or reading through the complete question pool (also available several places online). The choice between practice tests or reading the question pool depends mostly on your own preferred learning style (personally I find doing both most helpful).

From: Paul Nourse

I haven't looked at the extra class test. How would you rate the extra class test for a computer tech with electronics background building, repairing, creating. Would you say it would be hard, sort of hard, or just requires a brain. :-). I'm in my 50's so I went to school when they still taught you stuff.

I went back to college recently and I was amazed how stupid some people were. Down right scary. My wife's just finishing a culinary arts degree and half the people in her class still do not know basic measurements! Like how many ounces in a cup, stuff like that. I learned that in grade school. Lord love a duck my head going to explode. :-)

"Fasten" should be "taste", I hate automatic spell checkers. :-[

33218. The dreaded TX while programming issue

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-30 16:28:01 UTC
From: <ggutshal@...>
Topic: 33218 Message: 33218

I've seen a conversation around the issue where the programming cable causes the HT to key up. I also know there was a solution to the issue, but for the life of me I can't find that conversation. A friend has purchased one of those cables that causes that symptom. Can someone give me the Cliff's notes on the solution?

You can not just go in and take the Extra test only, without having passed the tests for Tech and General.

You must take and pass the previous elements, either having a license which shows you have taken and passed them, or taking those elements at the same session.

The tests must be taken and passed in order. I did this myself, walked in a wannabe, walked out having passed all three elements to receive the Extra class license.

I just took an extra class exam online. Doesn't look that hard. Was the test always that easy? Was it dumbed down from years ago?

1. Make sure the plug is fully plugged into the radio. This is a common problem and many that swear that it is in fully are surprised when they finally get it to snap in fully.

2. Make sure the driver is correct. For cables with an unauthorized copy or a Prolific chip, in Windows Vista/7/8, it should be v3.2.0.0. Visit the Miklor.com website for the driver and instructions to install it.

3. I have a cable that even though it is fully plugged in and is using the correct driver, it still causes the radio to key up. Even though the radio is keyed up, the cable still works for reading for and writing to the radio. I don't use it because I have many other cables available that don't cause the radio to transmit. If I was going to use this cable regularly, I would program a TX inhibited channel and always tune to it when programming the radio. If you read from the radio when tuned to this channel, then when you write to the radio using that image, the radio will be tuned to that channel after the upload process completes. Or if you are using CHIRP, you can preset the channel that you want the radio tuned to by using the Work Mode settings menu.

Also, yes, if you pass the Tech test, you may then take the General at the same exam session, and do so without paying an additional test fee. Should you pass the General, too, you may take the Extra at the same exam session for no additional fee. Anyone who passes the Tech should be offered to take the next test.

Also, anyone that schedules an exam with my team (I am a W5YI CVE)I highly encourage to study more than only the Tech. If you are smart enough to pass the Tech, you are smart enough to pass the General, too. At the very least, spend two additional evenings looking over the General material.

I have had people come in that ignored my suggestion, but passed the Tech. I then said, "OK, here's the General test." "But I didn't study that!" "Let's do it anyway."

One, a middle school English teacher, not someone who worked in a techy field, came within two questions of passing the General. Another came within 4. I asked afterwards, "If you had at least read over the material do you think you could have picked up a few more correct answers? If so, you likely would be a General right now."

Really guys and gals, do not shortchange yourself. And do not look at Tech as a stopping point. The General ticket is the most "bang for the buck."

If you are testing at an ARRL session you can essentially keep testing until you fail for one $15 fee. As an example suppose you take a tech exam and pass on your first try. You can then then the General exam for the same fee. However, if you take the tech exam and fail and would like a re-test that is considered a second session. You would need to pay another $15 and the VE team would issue you a different exam. Clear as mud?

The confusion may come from the "old days" where you could take the test on any level past novice without having the previous license. This may have changed (don't know myself) or that most VE test are upgrades and everybody is used to just seeing a previous license.
 I'm going to look it up before this turns into another "Yahoo fight".

Sent from Samsung tabletRix Seacord <eseacord@verizon.net> wrote:I'm sorry to say the answer below is wrong.
If it was correct than why do you have to show prove of having an existing license before sitting for the upgrade?
When my club holds test sessions, once/month, you have to show a current tech license to take the general and so on. This is not our policy but the fcc's. Copies of you existing license and proof of id are forwarded to the local ve coordinator then on to the fcc.

You can take any exam. The higher levels include elements from the
lower level exams.

Mike

the data in your email is cut off for me beyond BaofengF9...although it looks like the Nagoya(s) are all squelched???

Might be easier to get it to fit all properly by doing the data vertically.....

Great effort...looking forward to more results, since my Smiley is not making me happy right now....

--- In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

Best antenna comparison (for the search engine).
I did a quick test today at 2.15 miles to see if my setup works OK.
Not exactly line of sight but I'd say the curvature wasn't a whole lot from test to shack.
ICOM MK706MKIIG with Diamond X-30 attic antenna at approx 22ft AGL, 700ft ASL. I had squelch on S2 so I'm going to drop that a bit to hopefully let the stubbies work since 2 of them were squelched completely.
UV-5R at ~5ft AGL (I'm 6'1"), 640ft ASL handheld in front of face, antenna vertical, with mic approx 2 inches from mouth, facing shack.

Only did 146Mhz VHF as I have to take a trip home to switch to UHF. I've also got some more antennas coming.
There were 20-40 seconds between each test.
Here's the video I recorded and edited to remove some of the silence in between tests.
https://www.dropbox.com/s/z6e1kalniflqf1x/AntennaTesting20130829.wmv

I've ordered the results below from best to worst.
You'll notice a general pattern….half wave, 15" group, stubbies…pretty much what the theory says so is a bit satisfying to see.
I didn't try the MFJ-1714S with a segments extended to ¼ wave (I was in a bit of a rush) but will do that on my full test. I did try it full retracted and it wouldn't break squelch that way.
I've got some more antennas coming to add to the pile. And I may try some duct tape on the Smiley so I can at least test it.
I'll also have to get a scope and see if I can semi-calibrate the S-meter on my ICOM to better find out what the levels mean.
Since Baofeng doesn't label their antennas I put the radio model that the antenna came with for what it's worth. The UV-F9 looks like the "newer" one people talk about and it did worse than the UV-5R stock antenna. Also what's interesting is that the original stubby has a black label around the connector which says "FM.136-174/400-480MHz" and the "newer" stubby has a red label which says "UHF:400-480MHz" and I can't find the newer one on their website at all. That antenna came with my UV-F9.
Here's a picture of the two Baofeng antennas
https://www.dropbox.com/s/mmofkcufgl78k78/BaofengAntennas.jpg

Like all the amateur radio exams, the extra class test has been dumbed down several times -- which still leaves it harder than the lower level tests.

If you go back far enough, when Extra was created it required sending and receiving 20 words per minute Morse code, plus a long and complex written test that required not just recognizing answers but being able to draw complete circuit diagrams entirely from scratch given just the name of the circuit, as well as calculating values for the components of various L-C circuits, etc, etc.

On the other hand, a few years ago I studied for the Advanced class test (all I was actually interested in, because the few small Extra class band segments are trivial) -- after I passed the Advanced Class test, the VE encouraged me to take the Extra Class test while I was there. I didn't expect to pass because I had not even looked at the material, but I took the test anyway because it was free. I got a minimum passing score, which is how I went from Tech++ to Extra instead of from Tech++ to Advanced. I found it funny that one of the questions that I got right (enabling me to pass) asked for the test element required for an Extra class license. That, of course, was the element that I was taking and the designation for that element was on the heading of each page of the test.

You misunderstood my comment. The poster said you had to have a previous license before you could test for another. In all cases you have to pass the elements of the lower license to get the higher one. There's no legal requirement that you have an existing license before you test for a higher one. My VE session in New York City would allow me to go for my Extra out of the box. It would include all the elements for all lower class licenses. I would not be allowed to operate until I received the license. If I failed a lower class element I would be given credit for the elements I passed but would not receive a license until I passed the elements I failed. If I passed the Tech elements I could get a Tech license and would get credit for the higher class elements but no higher license. In my case I went for my No-code Tech then directly to Advanced. At the time there were No-code Tech, Tech with code, General, Advanced and Extra.

I was licensed in 1991. At no time could you pass the General
elements without passing all previous class elements. You missed my point.

You are correct, I misunderstood your statement to say that the Extra test (in and of itself) contained Tech & General elements. What you are actually saying is you can go into a VE testing session, and starting from zero can take Tech, General and Extra, all in one sitting and all for one fee (assuming you keep passing). That is correct. And, if you were to do it that way, you do not have a license at the time you are testing for any of the elements.

But you do need to pass the lower elements in order to progress to higher element tests (at least according to the ARRL and W5YI VE rules). So you could not go and sit for the Extra exam by itself, get a certificate of completion, then go at a later date and test for Tech and General and end up with an Extra class license.

In exam sessions I have helped with, we encourage anyone passing the Tech exam to take the General. It is not uncommon out of 10 or 15 people testing for Tech to have someone pass the General. If they do, we encourage them to try the Extra, but it is very rare that anyone passes it cold without prior study and preparation. But just taking the test helps them better study and prepare to take it at a later date.

Can anyone confirm what James said. I thought I read that it was $15 per time and not test. That you could take as many as you could pass in one sitting for one $15 payment. I probably read that wrong but my inquiring mind just gots to know... was it 5 bullets or was it six? ;-)

Gary...

I noticed you also hold an FCC License for GMRS (WPQS324). I too have both a GMRS (WQRJ816) license as well as a HAM (KC1ACR) license. As I stated in an earlier post I have radios typed for both bands but use the UV-5R HT's for both because I stay within the physical parameters outlined buy the FCC. And I don't feel as though I'm doing anything wrong when you consider how many repeaters are being used by GWRS built from transceivers type rated for ham, commercial, etc. What tramsceivers do you use for GMRS?

Well, I suppose many of us who are hams approach this from the "follow the law" perspective because in general, ham radio has successfully been self-policing since it started. This was built upon the fact that we were proud to be a member of this group and we wanted all of us to sustain a high standard in both operating practices and technical proficiency. Within the ham bands there are sub bands restricted to only certain classes of licenses. For the most part, hams even respect the operating privileges earned by their license and only operate in a sub band for which they are permitted. And here too, a ham license is "earned" as you have to pass a test and are not granted a license just for applying. That may be why some of us are quick to quote the law as an absolute.

That being said, I see the other side too. I have broken the speed limit. I have done home improvements without a building permit. I might have transmitted on frequencies for which I was not licensed.

I supposed it boils down to a few facts:

1 - The Baofeng radios are not type accepted for FRS, GMRS or Marine channels. It is illegal to use them for these purposes in the US.
2 - The FCC has more important things to do and is likely focusing no resources on this. Your chances of getting caught in the act are probably zero.
3 - If you do get caught you will have no ground to stand on. If you program a radio for a friend and they get caught, they will have a problem.
4 - The likelihood of getting caught increases if you build a large system such as a GMRS repeater with a hundred Baofeng users. The FCC may expend their resources for a big catch.

5 - The likelihood of getting caught increases if you have an adversary such as a competitor who knows you are doing this and turns you in.
6 - The likelihood of getting caught increases if you operate on an unauthorized frequency and the authorized folks complain of interference (regardless of type acceptance).
7 - There is the morality issue. The laws were supposed to be in place to protect the public interest. Often they are dumb laws but that's all we have. If you don't like the law you shouldn't promote public disobedience. Work to change the law within the system.
8 - There is the generally accepted practice that it is always a good idea to gain knowledge and understanding and then do the right thing. It is generally accepted that it is a good idea to help others grow and learn. Ham radio operators have tried to do this since the beginning of radio.

And finally.....
9 - Often people who are told they are doing something wrong don't like it when someone else brings it to their attention. Not liking it does not change the wrongness so they discredit the messenger.

So in the end folks will do what they want anyway. If people are guided by a ham or a Land Mobile Radio professional they will receive better advice than if they are guided by someone who only has opinions.

Your mileage may vary.

AMEN. A good rule of thumb is if we have exceeded the speed limit in the past year we need to keep our mouths shut and not point to the splinter in another's eye while we still have a log in ours.

Gentlemen,

I may not have been clear when I started this Hypocrisy thread. I was seeking less hypocrisy, not more. Less self-righteousness, not more.

As someone else has suggested, if you think someone needs to be warned that they are in danger of breaking a regulation, then send them a personal email.

This is not an FRS, GMRS or Marine Band Yahoo group. If you feel the need to 'police' these uses, please join the appropriate group. This group is about the care and feeding of Baofeng radios by radio amateurs.

Let's get back to that before we all unsubscribe.

You can register for a FRN number at the FCC website and not need a SSN for the exam. I used a FRN number matched to my FCC General radiotelephone license to take my exams.

The FCC will ask you for your SSN though.

Hmmm.... SSN, your Federal Part Number.

Do you happen to have menu 14 set to OFF? It should be set to ENG (or ON
for older radios) to be able to hear the 'low voltage' prompt.

DUI is considered a "dumb" law by many but it's in the best interest of the "public". How many members in this group do it anyway? And that would be hypocrisy.

If you program with CHIRP, you can email me you image file and I can take a look at it for unusual bits here or there. I have seen quite a few radios this year that have had a bit bit or more in their memory scrambled in a bad place and that caused their radio to do strange things. That is why I ended up making the 'reset' files available. You can upload the one that matches your firmware version and see if the issue goes away. If it does, just copy and past your channels from your image with the issue, the the 'reset' image and you'll be good.

The ARRL VEC has the test fee set at $15.00. The W5YI VEC did not increase the fee when allowed, and it remains at $14.00.

Of that $14.00, the VEC (the testing organization) gets $7.00, which pays for people to process the paperwork and do what they do to get you licensed with the FCC.

The CVE (Contact Volunteer Examiner, the head of the local test team) gets the other $7.00 for expenses. This includes printing, paper, and ink, pencils, gas, coffee, donuts, whatever. I have gone out of town many times to assist other teams, or to administer tests at their club. I'm not getting rich doing this. What I do get is a lot of enjoyment seeing new hams licensed.

Stephen,

I think you mean that this group is for general radio help for the Baofeng UV5R and variants; there is a more generic Baofeng group for Hams call Baofeng Ham. However, it is clearly stated on this group's home page that talk about using these radios outside of the Part 90/Part 97 uses, at least in the US, isn't permitted; I'd like to see people that would normally be "helpful" by mentioning that it's not legal to do that follow the rule that says not to respond when such discussions come up. The less we encourage discussion of such things, the less they will come up.

Gentlemen,

I may not have been clear when I started this Hypocrisy thread. I was seeking less hypocrisy, not more. Less self-righteousness, not more.

As someone else has suggested, if you think someone needs to be warned that they are in danger of breaking a regulation, then send them a personal email.

This is not an FRS, GMRS or Marine Band Yahoo group. If you feel the need to 'police' these uses, please join the appropriate group. This group is about the care and feeding of Baofeng radios by radio amateurs.

Let's get back to that before we all unsubscribe.

no, the problem is it never dies as long as the zombies rise rotting from the grave pointing what fingers they have left.

but let me try to be part of the solution ...

... many of my radio yahoo groups have an 'admission policy' of sorts to weed out obvious spambots where you have to say why you want to join the group or to introduce yourself before the moderator admits you.

how about we summarize the legality of operating the baofengs _in the USA_ and require anyone from the U.S. joining the group to sign off that they read the information page--specifically the legal statement, or even ask a specific simple question from the statement--and that they've bookmarked the miklor site. this way we could berate the deputy dogz when they turn into zombie fcc agents by saying the newbies already know the legality--they gave their word they read the legal statement.

this might not solve the two biggest traffic problems on the group, but at least we could see which newbies actually read the introductory information page and which signed off on it without reading or bookmarking the url. then we could be _justifiably_ self-righteous for a change! [g]

mostly serious here.

Matthew,

Good point. I find myself in the Pogo Situation: "We have found the enemy and it is us."

To be clear, it was my intention to convey that there are other and more appropriate venues for discussing FRS, GMRS or Marine Band radio usage on other Yahoo groups.

Such subjects are not relevant to amateur radio licensed use of the Baofeng.

I am not a big fan of heavy handed moderation, but I have seen some very good groups go under because no one stepped in and calmed the waters. With a big stick. :-)

33263. Re: Hypocrisy

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-08-31 02:00:12 UTC
From: Corey
Topic: 33130 Message: 33263

I take it the rules of the IC differ greatly from the rules of FCC. I was going back and forth with another candadian ham about rules and such, as he was advocating the use of ham spectrum for public safety groups.

I think this is where the breakdown occurs: Differing nations have differing views on what laws mean.

Here in the US: Break a law, and face consequences. Encourage law breaking, and enjoy the same.

Perhaps it's a differing legal stance in Canada?

I'm also familiar with many formulas. As a kid I was into Rocketry including trigonometry to calculate height using two nor more observers, electronic which I still build/repair equipment. I also enjoyed physics and algebra. My physics teacher who was a radio operator during WWII decided to get back into radio and proceeded to get every ham licence there was in very shot time while I was taking his class. Then I went back to college in 2007. I took the entrance exam and discovered I once knew all the algebra questions, past tense. :-). I could not remember form the life of me. Then they told my I did good on the algebra questions. Huh? That only means the kids today do not know any algebra and I look smarter by contrast. Oh my. :-(Things do come back very fast with just a little work. :-)

>Technical fields overlap so some of the questions will be easy. However, certain specific question will not be easy requiring you to guess. Also the math questions often center around resonance and other calculations requiring Smith Charts. In the computer field you have probably never used them. I had to use them while calibrating waveguides and other components used above 1 Ghz in a RF screen room calibration lab. That was the only time I used them, and almost forgot how to normalize the charts. So if you have not used some of the theory you learned you will forget it which we all suggest you to study the materials.

From: <kd5yqv@...>
Topic: 33165 Message: 33268

I took the radio completely apart, sprayed the PCB with the magic spooge from rustoleum, let it dry and put it back together. The NeverWet is quite thick. It builds quickly. Putting the PCB on the aluminum sink was pretty easy, but putting the assembly back into the plastic case involved some creative uses of strips of paper and a q-tip. I tried it about 7 times before I got it positioned in the case in a way that all of the buttons worked. The PTT button is, for whatever reason, the most difficult to get to work.

The radio works fine. It is waterproof. I dipped the PCB in water before assembly, and dipped the assembly in water after. Everything work.

I now have a splash proof radio that can be used in the rain and near the pool.

I don't recommend this, just buy another radio and avoid the excitement of dis-assembly.

Also, it leaves a frosted white look on everything. not that that matters much. .

R Pryor MAEd CETsr <doopsnoop@...> wrote:

No, that will work for water resistance properties but the actually water dive bag option is heavy duty with belt attachment holes and fasteners. it has a special extension for the antenna protrusion. If you are going to really use it around water, I would suggest getting these in case you drop your radio in the water (bag can be air cushioned to float).

The ziplock bags will wear or tear during radio control manipulation. The radio is water resistant out of the box with stock parts. The Baofeng Chinese videos show the radio being in a shower and operated for demonstration.

I have water bags here and will have them at the TRW electronics swap meet in Orange county this weekend (if you live in SCali) or if anyone is interested in various accessories and some home brew repeaters made from the Baofeng. I will have them on display there with some things for sale.

Subject: [baofeng_uv5r] Waterproofing using NeverWet

Yeah, It's probably not the best financial decsion to buy a 20 dollar water proofing system to treat a 30 dollar radio. I might as well buy a spare radio, I know.

I've been pretty eager to test out the NeverWet super hydrophillic spray by Rustoleum on electronics and I have a UV-5R that I have disassembled down to the circuit board. It's definitely cheaper than testing it out on a smart phone or the like, and it would be pretty cool to have a waterproof radio - although testing the waterproof-ness of the radio is pretty much a "it worked" or "your an idiot who just wasted 50 bucks" situation.

While I've got the radio apart, and before i put the Rustoleum chemicals on it (who knows what *that* smoke would do to you when heated with a soldering iron), I am going to do the modulation mod from http://www.gorhudson.com/gor/baofeng-uv-5r-modulation-fix/ N5GOR has some pretty good details and sketches about what to do.

So, has anybody else done this, or should I post a bunch of pictures and results?

Yes, just looked at it again a few minutes ago. I can follow those steps listed on the UV-5R group site.

I also checked the IC-7200, IC-718, Icom R75, NCE (model railroad DCC group), Saxophone Repair, and a number of other yahoo groups I belong to. All look the same.

One step I left out... if you change to Daily Digest or Web Only, then scroll down to the bottom and click "Save Changes".

Yahoo groups on the web seems to cutoff at that width for some odd reason. I'll switch to vertical from now on.

Smiley agreed to send me a new antenna gratis since the 1st one fell apart.

If anybody has any suggestions for my testing I'm all ears.

Plan on 3 distances – one nearer and one farther than this. I expect to see the same results unless the takeoff angle matters a lot on these guys for this testing.

You're right, it isn't a FRS,GMRS Marine band group. It IS however an Amateur band group. And in the US (and I'm pretty sure by your call sign you're not a resident of) amateurs are more or less mandated by the FCC to " police" the amateur bands. I'll be donning my Nomex skivvies now.

Gentlemen,

I may not have been clear when I started this Hypocrisy thread. I was seeking less hypocrisy, not more. Less self-righteousness, not more.

As someone else has suggested, if you think someone needs to be warned that they are in danger of breaking a regulation, then send them a personal email.

This is not an FRS, GMRS or Marine Band Yahoo group. If you feel the need to 'police' these uses, please join the appropriate group. This group is about the care and feeding of Baofeng radios by radio amateurs.

Let's get back to that before we all unsubscribe.

Mike

another comment to the test, is after its all finished, please provide the exact source where you got each antenna, so, as appropriate, we can go and buy it from the same vendor, especially with all the ebay/amazaon vendors out there....

Tnx

I gave that description in the thread. Also gave more experiment info previously in this thread.

Those are S-meter readings on my ICOM 706MKIIG. I've not calibrated it so don't know what they mean in absolute terms which I intend to do.

If we assume the ICOM is on the order of http://en.wikipedia.org/wiki/S_meter it would mean the MFJ-1714S ½ wave beats everybody by around 27dBm

Then comes most of the 15" group (NA-771 being the exception) beating the stubbies by 6dBm minimum.

I was considering testing belt-clipped too but that is very hard to reproduce as distance from the body is critical for that.

I may run one test belt clipped….as I noticed in earlier testing that putting the antenna close to your body lowers the frequency response.

So it's quite possible that the Diamond SRJ77CA may perform better than most since it's designed for the Part 90 band and lowering its minimum SWR point may make it better for 2M than most. So I may try and compare it against one or more of the equivalent 15" antennas.

One of the reasons I'm getting into this much analysis on antennas is due to problems at our police department (and no doubt others) with radio coverage…in particular when belt-mounted of course.

So I'm trying to get a good understanding of the specific effects.

Good morning all,

I was curious if anyone can help me with some ideas for an upgrade antenna system for my UV-5R.

I just want to extend my simplex/duplex range and even squirt the birds once and a while.

My ideas are a either a handheld or tripod mounted yagi beam, ground plane, or a dipole. I would like something that could be a catch all for 2m/70cm but am willing to build or buy two separate ones to maximize range potential for each band.

Looking for ideas and resources (books and websites with pictures, specifications, and places to purchase)

Thanks,
Dano

Yes, he sure covers the material well. Definitely an outstanding fellow Orange Countian. I had no idea he was half an hour away when I bought the books, though.Not that there are any questions at all that are specific to California...

And, all I've got left is the Technician's manual. The other two are already spoken for. So, if you know someone who's thinking about taking the test...

Subject: [baofeng_uv5r] Books for sale

My apologies if this isn't the proper place to offer these.

I have all 3 (Technician, General, & Extra class) of the Gordon West manuals for sale. These are the current editions and include the CDs. If you're thinking about taking the test, I highly recommend these. I studied these and took some online tests at eham and took all three tests at one sitting (and passed). They're great books, but they're just taking up shelf space here. For some reason, they're much more expensive than ordinary books; they cost over $20 a piece. Here's your chance to get licensed, or to move up, and save some money in the process:

Technician Class 2010-2014 $10

General Class 2011-2015 $10

Extra Class 2012-2016 $10

Add $2 for shipping, or buy all three and shipping is $5.

Dano,

I just did a Google search for "2m yagi" and got lots of hits. Some
show how to make one and others are for sale, such as this one:
http://www.arrowantennas.com/arrowii/146-3ii.html

Hope this helps,
Stephen

Yahoo groups on the web seems to cutoff at that width for some odd reason. I'll switch to vertical from now on.

Smiley agreed to send me a new antenna gratis since the 1st one fell apart.

If anybody has any suggestions for my testing I'm all ears.

Plan on 3 distances – one nearer and one farther than this. I expect to see the same results unless the takeoff angle matters a lot on these guys for this testing.

Dano,

I have ordered this antenna that I will carry in my pack on backwoods trips:
http://dx.com/p/rh-660s-10w-telescoping-vhf-uhf-sma-k-high-gain-antenna-for-walkie-talkies-black-169215

I suspect that a 41" whip on 2M will get out better than a rubber duck antenna.

Stephen

Yahoo groups on the web seems to cutoff at that width for some odd reason. I'll switch to vertical from now on.

Smiley agreed to send me a new antenna gratis since the 1st one fell apart.

If anybody has any suggestions for my testing I'm all ears.

Plan on 3 distances – one nearer and one farther than this. I expect to see the same results unless the takeoff angle matters a lot on these guys for this testing.

Actually I guess I should say Diamond technically has 3 “rubber ducks”. I don’t consider 15” antennas in that category but I guess they really are if you use the “electrically shortened rubber coated” definition.

There is a VE handbook available at the ARRL web-site; both from the Extra Exam question pool, and the VE handbook (Page 49, Order of Exam Elements), the tests can be taken in any order, but as stated previously, all elements up to the license level granted must be passed prior to granting the license. The specific referenced given "As an example of when a VE team may choose to permit examinations to be administered out of ascending order might involve a currently-unlicensed former General class licensee who comes to your examination prepared to take the General written test (Element 3), but is unaware that he will still have to take the Technician written test (Element 2)."

Proof of other elements can by license class, or CSCE. In theory, one could bring a CSCE for the Extra to an exam for the General, and CSCE for the Extra and one for the General to an exam for the technician, where one finally got a license for all three. However, if you are capable of passing the Extra, passing the General and Tech should not be that difficult. I have also not seen the reverse process in my 2 years as a VE. Like Paul, I took the exams in normal order and passed all three.

Note: failing any element, precludes taking the same or other elements, without repaying the Fee, leading most to try to get the simpler tests out of the way firs in order to get "something" for the fee.

How is this functionally different from a typical conformal coating, which is typically easily removable with isopropyl alcohol?

Neverwet:
http://www.homedepot.com/p/Rust-Oleum-Stops-Rust-18-oz-NeverWet-Multi-Purpose-Spray-Kit-274232/204216476

Just one example of an electronics grade conformal coating:
http://www.mgchemicals.com/products/protective-coatings/conformal/acrylic-conformal-coating-419c/

Mark

--- In baofeng_uv5r@yahoogroups.com, <kd5yqv@...> wrote:

I took the radio completely apart, sprayed the PCB with the magic spooge from rustoleum, let it dry and put it back together. The NeverWet is quite thick. It builds quickly. Putting the PCB on the aluminum sink was pretty easy, but putting the assembly back into the plastic case involved some creative uses of strips of paper and a q-tip. I tried it about 7 times before I got it positioned in the case in a way that all of the buttons worked. The PTT button is, for whatever reason, the most difficult to get to work.

The radio works fine. It is waterproof. I dipped the PCB in water before assembly, and dipped the assembly in water after. Everything work.

I now have a splash proof radio that can be used in the rain and near the pool.

I don't recommend this, just buy another radio and avoid the excitement of dis-assembly.

Also, it leaves a frosted white look on everything. not that that matters much. .

R Pryor MAEd CETsr <doopsnoop@...> wrote:

No, that will work for water resistance properties but the actually water dive bag option is heavy duty with belt attachment holes and fasteners. it has a special extension for the antenna protrusion. If you are going to really use it around water, I would suggest getting these in case you drop your radio in the water (bag can be air cushioned to float).

The ziplock bags will wear or tear during radio control manipulation. The radio is water resistant out of the box with stock parts. The Baofeng Chinese videos show the radio being in a shower and operated for demonstration.

I have water bags here and will have them at the TRW electronics swap meet in Orange county this weekend (if you live in SCali) or if anyone is interested in various accessories and some home brew repeaters made from the Baofeng. I will have them on display there with some things for sale.

Subject: [baofeng_uv5r] Waterproofing using NeverWet

Yeah, It's probably not the best financial decsion to buy a 20 dollar water proofing system to treat a 30 dollar radio. I might as well buy a spare radio, I know.

I've been pretty eager to test out the NeverWet super hydrophillic spray by Rustoleum on electronics and I have a UV-5R that I have disassembled down to the circuit board. It's definitely cheaper than testing it out on a smart phone or the like, and it would be pretty cool to have a waterproof radio - although testing the waterproof-ness of the radio is pretty much a "it worked" or "your an idiot who just wasted 50 bucks" situation.

While I've got the radio apart, and before i put the Rustoleum chemicals on it (who knows what *that* smoke would do to you when heated with a soldering iron), I am going to do the modulation mod from http://www.gorhudson.com/gor/baofeng-uv-5r-modulation-fix/ N5GOR has some pretty good details and sketches about what to do.

So, has anybody else done this, or should I post a bunch of pictures and results?

i have 4 nagoya antennas coming in from 3OC next week.

Nagoya UT-106UV-SMAJ Dual band 144 / 430 MHz Magnetic Mobile Antenna NAG-UT106UVSMAJ 1
Nagoya NA-771 Dual band 144 / 430 MHz flexible Antenna NAG-NA771 1
Nagoya NA-701 Dual band 144 / 430 MHz flexible Antenna NAG-NA701 1
Nagoya NA-702 Dual band 144 / 430 MHz flexible Antenna NAG-NA702 1

i also have a comet antenna analyzer i purchased about a month ago to help me tune some ham hf antennas for my kx3. all i have done so far with the analyzer is to verify it works and get some adaptors together--i haven't actually tried to use it seriously yet.

i realize that the comet's claim to fame is not to provide the most information and the one used in this thread puts it to shame in that regard, but it is the only one i know of that covers hf to uhf gapless.

the instruction sheet for the comet analyzer is just a few lines long. there are two scales and, as far as i can tell, two readings to look for: 1) the minimum swr and 2) nearness to 50ohm impedance.

i've noticed in casual testing that these two readings are not always the same. so my question is, should the resonant frequency of the antenna be taken from the 50ohm impedance mark, or from the minimum swr mark? my guess is the 50ohm mark as that should be the resonant frquency.

in any event, i will try to determine the resonant freqs of these antennas and post them here.

Hi Bob.

Well this group might be getting a few more members, as in the UK we have a monthly magazine by the name of Radio User. I had seen an article in the September issue about how bad the UV-5R user guide is. I have sent an article with a link to this group. So the end of September and the beginning of October, that is when you might see some more action on this site.

Bye from John in the UK

Hi, John in UK:

Sorry you experienced that unfortunate experience early on. I think the
fact that the focus of most postings and resulting discussion is due to the
fact that these radios are an inexpensive but somewhat useful amateur radio
for users in this country. While some comments posted could be offered in a
more friendly response, the great number of us are considerate and want only
to be helpful. Many among us have received and given useful assistance.
Stay with us!

73:
Bob Martin

I made that arrow antenna about ten years ago. I was just looking around the house wondering where it went. For 2 meters it worked very good. I was really surprised how bit performed. You unscrew the arrow shafts and store everything inside the square aluminum tube. It assembles very quickly. I'm sure its with my Yaesu FT209 I can't find. At least i put it somewhere safe. LOL

Greetings...

nobody answered your question...well, I would have pointed you in the right direction had I seen your post...but...I must admit..I don't read all the messages when I logon. Just the most current ones, and have to catch up when I got the time.

now...if you wanted to...you can simply make a slim jim for 440 only.
or you can modify the 2m to accomodate the 440 band.

N9TAX has an awesome solution for a dual band 2m/70cm band antenna.
But for this 2 slim jim 2m band antenna to work on 440....there is an awesome mod done to accomplish that. The link listed in the photoalbum "Dramatically Improve..."

http://ac8gy.com/dual_band_slim_jim_antenna.html

On his site...he actually has modeled the dual band slim jim on antenna modeling software...which I also loaded and looked at. it is impressive to say the least. He provides data on the "crossbar" that you add onto the 2m slim jim to resonate at 440 as well. I am currently in the process of deciding if I want to do this mod. I have learned so much from his website. He provides data on the SWR's when you mod your antenna. It is well worth checking out.

I have updated the ISO version of Chirp LiveCD. I have not uploaded the .exe version yet. It takes me about 30 hours per upload due to my extremely slow internet connection. I will try to get the exe uploaded in the next few days.

Like the previous updates, the only change is the new Chirp Daily (27 August) is included. If you are using a LiveUSB setup and have updated it using the Chirp Updater, there is no need to download this version.

For those wishing to use this as a LiveCD, you can download the .iso file and use your favorite CD burning software to create the disk or give me a few days to get the new exe uploaded.

300 ohm TV type twin lead works for J-poles and Slim Jims too. I suspect
the 450 ohm might work better, but lack any real data.

I took a look at the site and this seems to be way for anyone who is
having computer/driver problems in using CHIRP to be able to get around
that. Running the CD would start a Linux operating system on a windows
box. With CHIRP built in, it would provide a known workable way to use
CHIRP.

Have I got that about right?

And it would also be a way to carry your CHIRP on a CD, or a thumb drive
so you could use it with any computer you might have access to. Handy
on a trip when you won't be bringing your computer, but you might want
to add repeaters along the way. A thumb drive and your cable and you're
set.

Yes -exactly and it works great too. I didn't have the driver issues but
this is nice anyway as I can take the radio/cable and usb key to work
and go to town on my office computer without installing anything.

Web searches have shown a number of ways that people claim you can inhibit tx on a programmed channel in Chirp. One claim is that you set the Duplex column to "Off". The other I've seen claims you set the Duplex column to "Split" and enter "0.0" in the Offset column. Which (if either) is right, because I've tested both and there's no indication that transmission has been inhibited? (i.e. the display back-lighting still goes orange and there's no change in the information displayed)

I can tell you on my UV-5R BFB307 that setting Duplex=off and Offset=anything works for me (in other words offset doesn’t matter).

When I press transmit on such a channel nothing happens…no back light at all and no transmit (tested with another radio)….just like the key is dead.

Is there perhaps a firmware difference?

And…silly question….you did upload to the radio after making the changes?

On my UV-5RT, firmware BFS311, setting Duplex to 'off' does suppress transmission. It might be useful to note that 'off' is different than the default <None>.

Troy,

I wasn't doubting that a 3/4" J-pole would work well, it just seemed like a bit of overkill. Especially with the price of copper these days. :-)

Having said that, I know from antenna theory, that increasing the diameter of the radiator (the pipe size in this case) can increase the usable bandwidth of the antenna. I seem to recall that this is related to the 'skin effect', especially at higher frequencies?

You would have enough bandwidth on 2 meters FM with almost anything.
It is more a problem on 80 or 160 meters by far where wire cage antenna designs help out over a single wire.
The size of elements on a homebrew J pole may be a function of what someone already has or can get inexpensively.
A copper J pole sure would look good all polished up!

Hi I have a problem with my baofeng_uv5rplus. The display does not work. All i have is the screen with all the symbols that the screen has when you first turn on radio. It won;t go any farther than that. I can hear the voice in english but can't do anything else. I tried to reset the radio but still wont change the display back to normal. any help would be appreciated. Bruce Lhommedieu. brl715@...

1. Insert a 2.5MM 3-conductor plug into speaker/mic port (this disconnects
the internal speaker)
2. Turn on radio
3. Remove 2.5MM plug

Other than the above, I don't think there is a way to do it.

Actually, menu 8 does turn off the keypad beep, but has no effect on the start up.

Menu 8 just turns on/off the Keypad beep sound. It does not affect the little double beep heard at power-up. A pillow over the speaker, or a dummy 2.5mm plug in the headphone jack are pretty much the solutions.

Every memory channel of the UV-5R stores 4 bytes for the RX frequency and 4 bytes for the TX frequency. When you program the radio using the OEM software and you leave the TX column blank, this writes the decimal value 256 in each of the TX bytes and this causes the channel's TX to be inhibited. CHIRP does exactly the same thing when you set Duplex to "Off".

When turning on, just click the knob until on, but without turning up the volume. Let the radio boot up, and then turn up the volume.

My radio says my firmware is BFB297, when I hold 3 on startup. But if I
open the CHIRP .img file with Notepad and scroll to the bottom I see
that it is actually BFS311. I'm not sure it will make a difference, but
it might be useful to know for sure.

If you have problems reading the file just let us know.

This will work on new radios, but not the very earliest radios, like mine.
On these early radios, the volume does not go to 'zero' when volume knob is
at its lowest (turned on) setting. So on my radio I will hear the beeps
regardless of the volume control position.

Since RF travels via skin effect, the conductor need not be solid, hence the tubing rather than wire. You will also find that in most applications the larger the diameter of the conductor the wider the band with with the lower SWR (not all but most)

The group is not moderated.

No approval is required to join the group. There have been 105 new members in the last 7 days. I suggest requiring approval of new members as a help toward preventing spam, but without the major effort required to moderate a large and active group like this one.

:P Do you need a new credit card? how about a better rate on your
mortgage? or maybe you are looking for a better price on Satellite TV....
Well just visit http://www.<some radio related site here>.<com, net, org>
and get a new radio and we can sit and discuss the weather rather then give
our money to crooks. :P (had to make fun of the spam)

List approval is one part of moderation of a group; moderating the first few posts of a new member should be something that is done whether or not people really think moderation is needed or not. Unfortunately, I think Yahoo is trying to make that harder on those of us that do it in some group.

Yes, the group is moderated.

New members do require approval.

I and the other two moderators cannot watch the site every minute. And this one member's email sending spam was happening quickly, so there were a number of them before we caught it. Though the spam posts went out on one of the Daily Digests, we did delete them from the group Messages page.

Next step was to put the member on moderation, which means emails from moderated accounts come to us, the moderators first. We review and either approve or delete.

At that time I tried contacting the member to see if I could get any kind of response, to see if he was even aware that his email account had been compromised, and suggested a few ways to fix this. Meanwhile more spam emails, each with a different name, but all from the same email address, continued to roll in to us for moderating.

After several attempts to contact the member, nothing was heard, so this member has been removed.

Paul - AE5JU

Thanks Paul. Job well done.

--- In baofeng_uv5r@yahoogroups.com, <tenorman1952@...> wrote:

Yes, the group is moderated.

New members do require approval.

I and the other two moderators cannot watch the site every minute. And this one member's email sending spam was happening quickly, so there were a number of them before we caught it. Though the spam posts went out on one of the Daily Digests, we did delete them from the group Messages page.

Next step was to put the member on moderation, which means emails from moderated accounts come to us, the moderators first. We review and either approve or delete.

At that time I tried contacting the member to see if I could get any kind of response, to see if he was even aware that his email account had been compromised, and suggested a few ways to fix this. Meanwhile more spam emails, each with a different name, but all from the same email address, continued to roll in to us for moderating.

After several attempts to contact the member, nothing was heard, so this member has been removed.

Paul - AE5JU
Moderator - UV-5R Group

Yes, you never see the many we delete. Some for foul language, some simply rude and just not suitable here.

This is all done "behind the scenes."

But this recent spammer / bot / whatever happened quickly and slipped past us. One member contacted me to alert me (thanks, OM!), but I had already placed the offending member on moderation by that time. Since then another 8 or 10 spam posts, each just a few minutes after the previous one, came into the Moderation folder (for us Moderators it is marked "Pending" under the Messages on the left side of the group page).

Out of the 25 or so ham radio, model railroad, various saxophone Yahoo Groups I belong (and I moderate 5 more) to this UV-5R Group is the most active, by a large factor. It is difficult to keep up.

For example, I belong to the Windom antenna group, and get, perhaps, 3 or 4 posts in a Daily Digest once or twice a week at most. About the same for the Icom IC-7200 group. You know that we get 3 or 4 Daily Digests each day from the UV-5R Group.

There are four moderators now. We do try to stay on top of things.

73,
Paul - AE5JU
Moderator - UV-5R Group

You guys are doing a great job. I understand how that happened because it happened to me on another (non-Yahoo) list. I think someone got into the ISP mail list since I didn't do anything different. Had to dump my email and get another one from a different "source". Of course I got unsubscribed and a whole lot of s*** from other list members. So, be kind to these guys, it's not easy to keep track of all the traffic on this group. When I saw the spam come through, the first thing I thought was, "Oh no, not again!". :)

It is also possible to sent a message from any email account and insert the address of a list member in the from field to get it to post to the group. You can reduce spam and if your lucky have almost none. But zero is a bridge too far. I think the owner and moderators of this group are doing a great job.

33365. Connecting the Radio to the Computer for SSTV

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-02 18:45:12 UTC
From: Michael Boensch
Topic: 33365 Message: 33365

I have the UV-5R and I would like to make a cable to connect to computer audio card so I can use it for the SSTV. I have purchased 6 foot cable from 3 Old Crows but I am not sure if I need an audio transformer to isolate the signals between the computer and the radio. Thanks for your help.

From: Stephen Wandling
Topic: 33365 Message: 33366

It is typical to use transformer isolation on both audio paths. This is commonly done with 600:600 transformers. The more critical aspect is isolating the PTT, and this is commonly done with an opto-coupler.

A quick, and $100+, way to go is with Signalink, which I understand is a USB device, with lots of benefits. I intend to use an "Easy-Digi" board that's about $16, and is a very vanilla interface. I will pair it with a USB soundcard to eliminate issues with using the computer's soundcard.

I would very much appreciate being kept informed on your SSTV work.

You probably are getting unwanted spam, but you are NOT getting it via the group – perhaps it is time for you to discover how to read email headers.

Ridiculous!

Requiring approval for new members to join a group is a total waste of time unless there are very specific criteria by which the owner or moderators can identify valid applicants. No such criteria are available for this group. There is absolutely no way to tell a legitimate new member from a potential spammer.

If spam were a problem, the logical method would be to allow anyone to join the group (as we do now) and allow only members to post (as we do now) but to select the Yahoo Groups option to automatically moderate new members (which we do not do now). This way, only new members would require moderation - which holds down the burden to almost a reasonable level.

For most groups this setting works very well because in most discussion groups the majority of new members do not immediately post to the group. However, in a group like this, most new members join the group because they have a question to ask (and nearly all of them don't bother checking the archive to discover that their question has been asked and answered a few hundred times already). Other than a handful of old hands who stick around just to answer newbie questions, nearly all the traffic in this group comes from new members. The result is that moderating even just the new members would be quite a burden.

So.... We need to balance the burden of moderation against the benefit of eliminating spam.

A quick examination of the archives shows that the burden of moderating even new members would be quire high.

The same quick examination of the archives shows that there is VERY LITTLE spam posted to this group (and much of the spam is posted by established members, not newbies).

If we try to balance a high burden of moderation against the trivial benefit for reducing the extremely low level of spam in this group; I think the decision is clear. LEAVE THINGS AS THEY ARE NOW, BECAUSE THE SYSTEM IS WORKING.

Actually, if we wanted to get technical, any post from a resident of the US that wants to use this radio in a way that is not consistent with the rules here, and ignores the front page where it says that discussion of using the radio in that way isn't allowed is spam. And don't a lot of new users ask questions about exactly that, which does tend to annoy some people here?

Because sadly, complaining is such a large part of some peoples life. If someone insults me or some other not nice thing I do not get all upset. The problem is not with me. The problem is with the other person. It is they that are having a hard time dealing with life. Why would I want to engage in there problem, get upset over their misunderstanding or whatever. So when I see a few spams on a list this size get through I just ignore the anomaly. I don't get upset, I don't get raised blood pressure and live a much happier/longer life. :-)

Hello folks. I would like to purchase a UV5 as they seem like a good value entre into the hobby. I have a background in engineering and studied some for the Technician Class test but just haven't gotten over to take it yet. I think I will be able to get through it. Also I'm fortunate to have a very active Ham community here in the Raleigh/Durham/Chapel Hill area of NC which I'm sure will be a plus.

I found UV5RE+ on Amazon for $33.00 which seems insanely cheap. But I sure would like to be able to use the 3800 mAH batteries. I understand that the only barrier to using them on the newer radios is the little flange on the bottom of the radio doesn't fit right into the battery. Am I correct in assuming this can be overcome with a dremmel tool or possibly a butane micro-torch? I saw a couple of videos suggesting that was the case. The reason I like the UV5RE was that there was a picture of the radio displaying BFB295 which looked like pretty much the newest firmware. Plus I mean come on ... $33 ?!! Dang ...

Dallas

33385. Win 7 drivers

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-03 06:31:31 UTC
From: wayne
Topic: 33385 Message: 33385

All the drivers I have found that is suppose to work with Win 7 will not work, any help will be really appreciated.
I have the UV5R the programing cable and the software...

Thanks

Dalllas,

If I may make a suggestion. There is a ham on this board that has a store and a website. Look up threeoldcrows.com. While you are at it, get a different antenna that the one that comes with the radio. the rubber duck on the radio sux. I believe he is in a place called Keller Texas. I got one of my radios and the antennas from him. You will also need the programming cable. To quote my kid brother when I told him I I had gotten my ham ticket many years ago. He said it was like getting married. It wasn't the cost of the license, it was the upkeep. Welcome to the group and I don't think you will have much problem passing the Tech test.

Quick question Ed,

Can you hit a St. John's repeater out there in Concho, or is there a better one to try? I was especially wondering if any of the ARA Rim-Link machines (either on 2m or 70cm) are close enough to bring up with the UV-5R?

33392. A new twist on the programing cable plug issue?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-03 08:20:41 UTC
From: Bill Maxwell
Topic: 33385 Message: 33392

For what it is worth, I have just programed three new UV-5R, using Baofeng's VIP software.I initially had trouble getting the radios to respond, before remembering that I had to download the appropriate version of VIP for the firmware involved. My two-year old original Boafeng software refused to play at all with these radio's version of the firmware, although it had successfully programmed my original UV-5R way back when.

The correct version of VIP fixed one radio but I then struck a further problem with the other two. It seemed to be an instance of the old "not fully inserted" programing plug issue but I really couldn't get it any further into the jacks. I eventually realised that the problem was a slightly different iteration - the audio jacks on each radio were not centred in the case cut-out, but off-set to the rear, meaning that the programing plug could not fully insert into the jacks, without impacting the side of the case. The one that worked had its jacks nicely centered in the cut-out.

Armed with this observation, I managed to twist, rather than push, the programing plug into position and both errant radios then accepted programing. A permanent fix would require either removing plastic from the case cut-out, or perhaps shaving some of the soft plastic from the side of the two-pin programing plug, rather than from the bottom as has worked for some others.

as all other firmware releases since BFB297, 311 masquerades as BFB297 when
radio is powered on while the [3] key depressed.

The differences between firmware versions have relatively minor over the
life of the UV-5R. So far there have been no user detectable differences
since BFB295 (for a list of what differences have been discovered, see the
Miklor.com FAQ pages). Unless you want to make sure your flashlight has a
flashing mode, there really hasn't been a good reason to choose a UV-5R
based on firmware version.

I think the "off-set" audio jacks are a common problem right now. There
have been quite a few UV-5R owners recently that can't get any programming
software to work. Their symptoms are the classic "plug not fully engaged".

Thanks for the post.

Thanks for all the responses everyone. I did understand from the miklor site that there were releases after BFB295, I just didn't see any functional difference mentioned for them. So I figured that anything from BFB295 up was the same. Below that I saw differences in programmable parameter ranges etc and figured those differences were important.

Anyway I did go to threeoldcrows and that brought up another question though I think I know the answer. Are the radios labeled BF-F8 for instance just newer firmware variants? I swear the Chinese guys making these things need to adopt a uniform labeling scheme.

Thanks again,

Dallas

BFB295 was shipping around November of 2012. There has been at least 6 firmware releases since then. BFS311 is the latest that I am aware of. Same as all other firmware releases since BFB297, 311 masquerades as BFB297 when radio is powered on while the [3] key depressed.

The differences between firmware versions have relatively minor over the life of the UV-5R. So far there have been no user detectable differences since BFB295 (for a list of what differences have been discovered, see the Miklor.com FAQ pages). First, don't get overly concerned with the Firmware version. It doesn't really make a lot of difference other than cloning straight from one radio to another (no computer, direct copying). Even there, you can clone across any of the newer versions from the last year or so.

If you want the widest choice of accessories, get a plain UV-5R.

Battery fit, do NOT use a torch! I assume you are joking there. Some Dremel work on some, but easier to just by a regular UV-5R.

The standard 1800 mah battery will last 2-3 days of a lot of use. The 3600 or 3800 mah batteries will last 4-5 days, longer with moderate use. I used a pair of UV-5Rs at the finish line of a 135 mile canoe & kayak race, reporting back though our repeater to boat race central. Using them all day resulted in recharging in less than an hour. I had extra batteries, but didn't need them, and could probably have gone several days at that rate.

Setting the radios to the local NOAA weather channel, turning up volume to almost distorting, letting them run all night, they went about 24 hours before indicating they needed recharging.

Antenna is a good place to look for improving performance. Here most of us use the Nagoya NA-701 and Puxing J0125A (the famous $3.79 antenna that now sells for about $4.25), with a few using the NA-771 (16" long!!! that'll put your eye out!).

Don't bother with any of the Baofeng software... CHIRP is the way to go. Discard any CDs you get with the radio. And toss the cheesy, useless manual. There is a great manual availabe via a link on the Miklor site.

And lots of great advice on this site, which will mostly direct you to the Miklor site. (Miklor, Miklor, Miklor... is there an echo in here?) Seriously, that site has all you need to know and then some.

Hey, Wolf, quit ragging on the light! I actually needed and used that during Hurricane Isaac when the power went out at the club station.

I thought it was a gimmicky feature until I actually needed it.

Really! ;-)

Dallas,

I will jump in her if you don’t mind. The F8, F8+ and F9 are the exact same electronics package as the UV-5R, just different plastic shells.

· The F8 does not have a LED (Flashlight) or a BAND button (which is useless since firmware BFB291)

· The F8+ has the flashlight LED but no band button – Available with standard tri-color backlit LCD or white on black LCD

· The F9 is a different case style completely, and does not have a BAND button. – Available with standard tri-color backlit LCD or white on black LCD

I have attached images of the UV-5R, BF-F8, BF-F8+ and BF-F9

All of the radios in my inventory are either BFB305 or BFS311 firmware.

Actually, there has been no activity with "The (Chinese) Radio Documentation Project" since the initial 1.0 release of the UV-5R manual. The manual really does look outstanding but some of info contained in it was incorrect or out-of-date. I spent quite a bit of time annotating the original manual and then submitted it to the author hoping to get a really awesome manual. Apparently something came up and the project has died shortly after it was born.

Anyway, so as not to be wasted effort, I made the annotated manual available to everyone. The original and the annotated version can both be obtained from the Miklor.com website. I've updated the annotations a few times since it was originally done toward the end of last year.

33407. Moderation criteria

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-03 15:17:53 UTC
From: tenorman1952
Topic: 33407 Message: 33407

With the recent (minor) outbreak of spam there was discussion of whether or not this group was moderated. It is. There are four moderators for now.

Understand that this is a VERY active group and it is impossible to catch everything immediately. We (mods) have a life and do other things besides read this group.

Moderation... this may involve removing an offending post. This happened with the recent spam. We deleted the posts from the Messages page of the Group, but those posts had already gone out on a Daily Digest or Individual Email. Those can't be undone.

A member that has a track record of rude, offensive, vulgar posts may be put on "Moderated Status". This means that the member's posts will come to us, the moderators first. We may (buttons along the top of the moderated post) Edit, Approve, Delete, Remove the member.

I won't edit your post. If it is that bad, I'll simply delete it. I won't remove a member except as a last resort. I'll contact the member, tell him why he is on moderated status.

I will not delete your post because I disagree with you opinion. I won't delete your post even if I know it is wrong. Believe me, there are plenty of other members that will correct any misunderstanding... haha! But if the post contains threats, vulgarity, or is otherwise simply not done in polite company, then it will be deleted. This is in the Rules of Engagement in nearly every Yahoo Group and Forum on the internet. Come on, guys, you know what's right and wrong.

Neither I nor the other moderators will delete posts heavy handedly. The less the better. But as far as "but what about my freedom of speech?" argument... say what you want, other places, but you don't go into someones home and spray paint vulgarity on the walls and then claim "freedom of speech". Well, the same thing here.

Fortunately, with as many members as this site has, as active as it is, there are very few members on Moderated Status, and even there, few posts are deleted.

I just wanted to explain what Moderation is, how it is done, and you already know why.

Removing spam is easy, a no-brainer, Delete! And it is something we simply have to put up with on the net. I'm quite surprised we have not had more problems, as active as this group is.

Moderately yours,

Paul - AE5JU
Moderator - UV-5R Group

Hi Everyone-

I can't find it anywhere on the net so I thought I would turn to the experts.

Is it possible to listen in on police, CHP, Fire, etc. communications with a stock UV5r Plus? I am studying for my test here in the Bay Area and just wanted to see how my radio sounds and what's happening in the area. I know you can't transmit at all without the appropriate licenses.

Question: Do I need to hack this radio? What do I need to upgrade, patch etc. on this guy?

Any help for a noob would be appreciated, I don't want to do anything wrong and piss off the community.

Thanks in advance
Scott

I would bet money that the PD, FD and others in the Bay area are on what is called P25 or digital. And the answer to that is a flat NO. The radio will only listen to conventional analog. However on the off chance that I am wrong, go to www.radioreference.com and select databases at the top of the screen and then go to where you are. You have a list of all of the freqs in use. You may find some analog ones and get a hit on it. The list will probably also include some of the parks in the area and they may be on analog. Even a used scanner for the digital is over a couple of hundred last time I looked.
Good luck and welcome to the ham community. (in advance)

Ah, thanks so much for the help. I was actually able to hit a few local repeaters but the emergency listings were coming up blank, so the info about digital makes perfect sense. I went to an online site where you can listen: http://www.broadcastify.com/listen/ctid/223 so I guess I am stuck with that for now.

I am really excited about my new toy and have been able to get a taste of the action to keep me motivated.

Thanks again you guys are awesome.

PS: When I get better at my + model, I plan on making a video of the process to find and input repeaters. Each video I watched always seemed to leave out a minor detail and it took me a few different videos to finally piece it all together. It the +/- and the CTCS and Offset.

I will hit the manual tonight after practice tests.

Cheers
Scott

Scott,
As long as the frequencies fall within the range of the UV5R and the service you are trying to receive is not running digital, you should be able to receive them.
For Opening Up info, refer to http://www.miklor.com/uv5r/UV5R-220.html
The Software section will show you how to Lock Out the transmitter and unwanted Scanning Frequencies. http://www.miklor.com/UV5R

Subject: [baofeng_uv5r] Baofeng Police Freq Question

Hi Everyone-

I can't find it anywhere on the net so I thought I would turn to the experts.

Is it possible to listen in on police, CHP, Fire, etc. communications with a stock UV5r Plus? I am studying for my test here in the Bay Area and just wanted to see how my radio sounds and what's happening in the area. I know you can't transmit at all without the

appropriate licenses.

Question: Do I need to hack this radio? What do I need to upgrade, patch etc. on this guy?

Any help for a noob would be appreciated, I don't want to do anything wrong and piss off the community.

Thanks in advance
Scott

Ok. Let me see summarize what I understood from the responses here, some off-list dialogs, and observations I made just shopping around and looking at pictures etc.:

1) All the radios have the UV5R through BF-F9 are really the same hardware.
2) The 3800 mAH batts fit the UV5R and the F8, F8+ and F9 without modification.
3) All firmware versions are pretty close to the same.
4) BFB311 is the newest firmware but there are no known functional changes since BFB295.
5) Newer radios will have newer firmware regardless of packaging. That is a UV5R made last week will have the newest firmware where as one made last year would have an older release. Firmware version is NOT tied to the model designator.
6)The BF-F8, F8+ and F9 don't have the band button because they don't need it. [That one I'd like a little more explanation on if anyone is willing)
7) Buy from an American Distributor. Dealing with offshore distributors can be problematic.

As for number #7 above, I don't want to start a war. Just looking to make an informed decision and that was a suggestion I got. PLEASE DON'T SHOOT! :-)

Thanx again for the responses,

Dallas

Exactly what repeaters were you 'able to hit' without a license??? Kerchunking a repeater is highly frowned on.

'Kerchunking' is a legitimate way of quickly checking your ability to open a repeater.

It does not take up any time or involve lots of inane chatter.

I say go for it.

Dallas, I'll add one more. If you need the radio in Part 90 Certification service. Ask the American Vendor if the radio has the correct sticker...not the generic factory one.

The [BAND] button was never a must-have accessory because the user could always switch bands using menu 33 (BAND).

For firmware versions prior to BFB291, the user had to select the VHF band before a VHF frequency could be keyed into the VFO. The user had to select the UHF band before a UHF frequency could be keyed into the VFO. For these radios, the band button was mighty convenient.

Menu 33 (BAND) also has a bug/feature where if you key a frequency into the VFO, then use the menu 33 to switch to the opposite band and then again to return to the original band, the VFO would be reset to that band's low frequency limit. Doing the same thing with the [BAND] button and you would return to the original with the original frequency still showing in the VFO.

Firmware versions BFB291 and forward automatically select the band based on the first digit entered into the VFO. 1=VHF and 4 or 5 = UHF. You can still manually switch between the bands using menu 33.

So you REALLY think it's okay to Kerchunk a repeater, especially one he doesn't have a license top use??? So that would mean you'd okay him doing it on Public Safety repeaters as well???
